ACCESSION NUMBER RANGES

Accession numbers cited in this Supplement fall within the following ranges:

STAR (N-10000 Series) N75-28003—N75-29995

IAA (A-10000 Series) A75-38854—A75-41898

This bibliography was prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by Informatics Information Systems Company

AERONAUTICAL ENGINEERING

A Special Bibliography

Supplement 63

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in October 1975 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA)*

Scientific and Technical Information Office
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
Washington, D.C.

NOVEMBER 1975

This Supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, for \$4.00. For copies mailed to addresses outside the United States, add \$2.50 per copy for handling and postage.

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971. Since that time, monthly supplements have been issued.

This supplement to *Aeronautical Engineering—A Special Bibliography* (NASA SP-7037) lists 340 reports, journal articles, and other documents originally announced in October 1975 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* or *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes—subject, personal author, and contract number—are included.

An annual cumulative index will be published.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A75-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc (AIAA), as follows. Paper copies are available at \$5 00 per document up to a maximum of 20 pages. The charge for each additional page is 25 cents. Microfiche⁽¹⁾ are available at the rate of \$1 50 per microfiche for documents identified by the '#' symbol following the accession number. A number of publications, because of their special characteristics, are available only for reference in the AIAA Technical Information Service Library. Minimum airmail postage to foreign countries is \$1 00. Please refer to the accession number, e g (A75-10763), when requesting publications.

STAR ENTRIES (N75-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail NTIS Sold by the National Technical Information Service to U S customers at the price shown in the citation following the letters HC (hard, paper, or facsimile copy). Customers outside the U S should add \$2 50 per copy for handling and postage charges to the price shown. (Prices shown in earlier *STAR* volumes, 1962-1974, have been superseded but may be calculated from the number of pages shown in the citation. The price schedule by page count was given in the last *STAR* issue of 1974 or may be obtained from NTIS.)

Microfiche⁽¹⁾ are available at a standard price of \$2 25 (plus \$1 50 for non-U S customers) regardless of age for those accessions followed by a '#' symbol. Accession numbers followed by a '+' sign are not available as microfiche because of size or reproducibility.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Unit.

NOTE ON ORDERING DOCUMENTS When ordering NASA publications (those followed by the '*' symbol), use the N accession number.

NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number.

Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail SOD (or GPO) Sold by the Superintendent of Documents, U S Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard \$2 25 price, for those documents identified by a '#' symbol.)

(1) A microfiche is a transparent sheet of film 105 by 148mm in size containing as many as 60 to 98 pages of information reduced to micro images (Not to exceed 26:1 reduction).

Avail NASA Public Document Rooms Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory

Avail ERDA Depository Libraries Organizations in U.S. cities and abroad that maintain collections of Energy Research and Development Administration reports, usually in microfiche form, are listed in *Nuclear Science Abstracts*. Services available from the ERDA and its depositories are described in a booklet, *Science Information Available from the Energy Research and Development Administration* (TID-4550), which may be obtained without charge from the ERDA Technical Information Center

Avail Univ. Microfilms Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) at \$10.00 each and microfilm at \$4.00 each regardless of the length of the manuscript. Handling and shipping charges are additional. All requests should cite the author and the Order Number as they appear in the citation.

Avail USGS Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail HMSO Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail BLL (formerly NLL) British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail ZLDI Sold by the Zentralstelle für Luftfahrt-dokumentation und -Information, Munich, Federal Republic of Germany, at the price shown in Deutschmarks (DM).

Avail Issuing Activity, or Corporate Author, or no indication of availability Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail U.S. Patent Office Sold by Commissioner of Patents, U.S. Patent Office, at the standard price of 50 cents each, postage free.

Other availabilities If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

SUBSCRIPTION AVAILABILITY

This publication is available on subscription from the National Technical Information Service (NTIS). The annual subscription rate for the monthly supplements, excluding the annual cumulative index, is \$18.00. All questions relating to subscriptions should be referred to the NTIS.

ACCESSION NUMBER	N75-10005*# Lockheed-Georgia Co. Marietta	CORPORATE SOURCE
TITLE	GROUND EFFECT FOR V/STOL AIRCRAFT CONFIGURATIONS AND ITS SIMULATION IN THE WIND TUNNEL PART 3 THE TANGENTIALLY BLOWN GROUND AS AN ALTERNATIVE TO A MOVING GROUND APPLICATION TO THE NASA-AMES 40 BY 80-FOOT WIND TUNNEL	PUBLICATION DATE
AUTHOR	J E Hackett, E B Praytor and E O Caldwell [1973] 59 p refs	AVAILABILITY SOURCE
CONTRACT OR GRANT	(Contract NAS2-6690) (NASA-CR-114497) Avail NTIS HC \$4 25 CSCL 01B	COSATI CODE
REPORT NUMBER	<p>A set of conceptual drawings showing the application of slot-blowing boundary layer control to the 40- by 80-foot wind tunnel is presented. In small scale pilot experiments unswept slots were used fed by a below-floor plenum. The model was sting mounted and its wing was unswept. However, design for the Ames tunnel was heavily constrained both by under floor balance mechanisms and by a large turntable. An over floor supply system was therefore designed. A description of appropriate procedures for using the floor tangential blowing system is given. Though some of the operating graphs are specific to the design for the Ames tunnel, both non-dimensional plots and the approach generally are widely applicable.</p> <p>Author</p>	

TYPICAL CITATION AND ABSTRACT FROM IAA

NASA SPONSORED DOCUMENT		AVAILABLE ON MICROFICHE
ACCESSION NUMBER	A75-10336*# Sealing technology for aircraft gas turbine engines	TITLE
AUTHORS	L P Ludwig and R L Johnson (NASA, Lewis Research Center, Cleveland, Ohio) American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Conference, 10th, San Diego, Calif, Oct. 21-23, 1974, AIAA Paper 74-1188 12 p 23 refs	AUTHORS' AFFILIATION
	Experimental evaluation under simulated engine conditions revealed that conventional mainshaft seals have disadvantages of high gas leakage rates and wear. An advanced seal concept, the self-acting face seal, has a much lower gas leakage rate and greater pressure and speed capability. In endurance tests (150 hr) to 43,200 rpm the self acting seal wear was not measurable, indicating that noncontact sealing operation was maintained even at this high rotative speed. A review of published data revealed that the leakage through gas path seals has a significant effect on thrust specific fuel consumption, stall margin, and engine maintenance. Reducing leakages by reducing seal clearances results in rubbing contact, and then the seal thermal response and wear determines the final seal clearances.	TITLE OF PERIODICAL

IAA ENTRIES

A75 38901 Fiber composite structures M Salkind (Avco Corp., Avco Systems Div., Lowell, Mass.) *JOM/Journal of Metals*, vol 27, May 1975, p 15-19 19 refs

The advent of boron, graphite and Kevlar fibers, and the rediscovery of glass fibers for highly loaded structures have revived interest in the use of composites for aerospace applications and for sporting equipment, high-speed machinery, automobiles, etc. Characteristics of composites which make designing with them different from designing with metals are considered. The nearly linear behavior to fracture and lack of plastic yielding is typical for most composites. The fatigue behavior shows a variety of failure modes including fiber-matrix debonding, delamination, fiber breakage and matrix cracking. Due to the flat nature of the S-N curve, composites are highly fatigue resistant and their relative sensitivity to stress concentrations in fatigue is the opposite to that of metals. Test and service experience indicate that composite structures are safer and more reliable than metals. Advanced development of eutectic composites for applications in the hottest parts of the turbine engine should provide improved efficiency by increasing allowable metal temperatures. M G

A75-39017 Anglo-American Aeronautical Conference, 14th, Los Angeles, Calif., August 4-7, 1975, Technical Papers Conference sponsored by the American Institute of Aeronautics and Astronautics, Canadian Aeronautics and Space Institute, and Royal Aeronautical Society. New York, American Institute of Aeronautics and Astronautics, Inc., 1975 82 p

The present collection of papers deals with airline fuel problems, several important aspects of advanced cargo aircraft systems, and future trends in civil aircraft operation in the so-called terminal movement area. Also discussed are the overall program for the design and development of the supersonic fighter-trainer aircraft Jaguar and the use of a 5 x 5 ft wind tunnel with a high Reynolds number for the development of modern airfoil sections. The potential of new subsonic transport aircraft designs that may evolve in the relatively near future is examined along with prospective heat-exchange aircraft engines in which the heat-exchanger cycle still remains impractical until further progress in structural design and materials is achieved.

Individual items are announced in this issue. S D

A75-39019 # The challenge to advanced cargo aircraft systems F A Cleveland (Lockheed Aircraft Corp., Burbank, Calif.) In Anglo-American Aeronautical Conference, 14th, Los Angeles, Calif., August 4-7, 1975, Technical Papers. New York, American Institute of Aeronautics and Astronautics, Inc., 1975 11 p

The paper deals with the potential of advances in individual technologies, assesses the economic promise when integrated into total systems, and presents some conclusions defining a few of the most likely possibilities. Six areas of advanced technology are discussed: superficial aerodynamics, friction drag reduction, induced

drag reduction, active controls, composite materials, and improved specific fuel consumption. Economic viability is examined along with benefits of advanced technology and larger-sized aircraft. The modular approach to a family design with maximum commonality offers a possibility that could be applied across a broad spectrum of potential air cargo transports. Whether derivatives or new systems prevail, only through persistent research and development efforts can the many potential improvements in fuel conservation, other operational cost factors, and production costs be realized. S D

A75-39021 # European collaborative military aircraft programme - Jaguar I R Yates (British Aircraft Corp., Ltd., Preston, Lancs., England) In Anglo-American Aeronautical Conference, 14th, Los Angeles, Calif., August 4-7, 1975, Technical Papers. New York, American Institute of Aeronautics and Astronautics, Inc., 1975 11 p

The overall program for the design and development of the Anglo-French tactical fighter-trainer supersonic aircraft called Jaguar is described. The discussion covers the background of Anglo-French collaboration and management in solving problems associated with the airframe and engines of the Jaguar. Considerable wind tunnel testing is done and great care is taken to shape the rear fuselage lines above the jets to minimize base drag. Changes between the first prototype and the final production aircraft are examined. The production and in-service phase is outlined. S D

A75-39022 # The role of the NAE 5x5 foot wind tunnel in the development of modern airfoil sections L H Ohman (National Research Council, Ottawa, Canada) In Anglo-American Aeronautical Conference, 14th, Los Angeles, Calif., August 4-7, 1975, Technical Papers. New York, American Institute of Aeronautics and Astronautics, Inc., 1975 16 p 33 refs

A brief history of this unique facility is given, followed by a description of certain features added in recent years to enhance the facility's usefulness in modern airfoil development, by providing data at realistic Reynolds numbers, particularly at transonic speeds. The characteristics of a large variety of airfoils have been investigated, classical NACA sections, supercritical airfoils, jet flap and augmentor wing sections as well as airfoils with mechanical high lift devices. Selective results from these investigations are presented, demonstrating the effect of Reynolds number on airfoil characteristics and the potentials of recent advances in section design with regard to drag, lift and buffet. (Author)

A75-39023 * # Advanced subsonic aircraft concepts for passenger transportation M H Waters and L J Williams (NASA, Ames Research Center, Moffett Field, Calif.) In Anglo-American Aeronautical Conference, 14th, Los Angeles, Calif., August 4-7, 1975, Technical Papers. New York, American Institute of Aeronautics and Astronautics, Inc., 1975 8 p 10 refs

This paper discusses the potential for new subsonic transport aircraft designs that may evolve in the relatively near future, taking into account the added requirements for improved environmental compatibility and the potential constraints due to system congestion, substantial financial risk, and higher fuel costs or limited availability. Reflecting these additional requirements, potential aircraft developments are presented for new CTOL transports with significantly improved fuel economy, new STOL transports with improved short field capability, and new VTOL transports that could provide direct city-center service. (Author)

A75-39084 Instrumentation requirements relative to federal aircraft emission regulations W T Westfield (FAA, Washington, D C) and G D Kittredge (U S Environmental Protection Agency, Washington, D C) In International Instrumentation-Automation Conference, New York, N Y , October 28-31, 1974, Proceedings Part 2 Pittsburgh, Instrument Society of America, 1974, p 632 1-632 5 10 refs

A description is given of the views of the Environmental Protection Agency and the Federal Aviation Administration with regard to the pollutant sampling and measurement requirements embodied in the Federal aircraft emission regulations The pollutants which are to be measured are considered along with pollutant sampling and measurement problems characteristic of turbine exhaust Questions regarding measurement instrumentation are discussed and attention is given to the role of government/industry information exchange G R

A75-39090 The employment of Kalman filter technology for the improvement of the signal quality of a microwave beacon system (Anwendung der Kalman-Filtertechnik zur Verbesserung der Qualität der Signale eines Mikrowellenleitetstrahlsystems) P Wust (Bodenseewerk Gerätetechnik GmbH, Überlingen, West Germany) In Applications of the Kalman filter technique in the Federal Republic of Germany, Joint Meeting, Frankfurt am Main, West Germany, November 27, 1974, Reports Dusseldorf, Deutsche Gesellschaft für Ortung und Navigation, 1974, p 75-92, Discussion, p 93, 94 In German Research supported by the Bundesministerium der Verteidigung

It is planned to increase the steepness of the angle at aircraft takeoff in order to reduce the molestation by aircraft noise The information required by the flight control system and the flight-path control device for such a maneuver will be provided by a microwave system Two filter designs for such a system are discussed The merits of one filter design have already been studied in a flight test The second design is still in a state of development The equations of the discrete Kalman filter algorithm are considered along with the equations of a sensitivity analysis G R

A75-39220 # The effect of the surface roughness of blade profiles on the flow characteristics of a turbine (Der Einfluss der Oberflächenrauigkeit von Schaufelprofilen auf das strömungstechnische Verhalten einer Turbine) H Sandstede Hannover, Technische Universität, Fakultät für Maschinenwesen, Dr.-Ing Dissertation, 1974 183 p 50 refs In German Research supported by the Deutsche Forschungsgemeinschaft

The flow characteristics in the case of a four-stage turbine were investigated for various blade roughness magnitudes It was observed that blade roughness had the greatest effect on turbine-efficiency values Effects of blade roughness on the operational characteristics of the turbine were also observed Computations based on a procedure reported by Bammer and Fiedler (1964) were conducted, taking into account the conditions considered in the experimental investigations Computed values and experimental data are compared G R

A75-39223 # Impact of a flight vehicle on a spherical shell (Stoß eines Flugkörpers auf eine Kugelschale) J W Hammel Darmstadt, Technische Hochschule, Fachbereich Mechanik, Dr.-Ing Dissertation, 1974 105 p 47 refs In German

An analysis is conducted of the stresses that are produced in structures which are subjected to an impact involving a flight vehicle The deformations of the flight vehicle and of the structure are taken into account The characteristics of the flight vehicle are approximated with the aid of a spring-mass system with dashpot dampening The structures considered include a planar plate and a spherical shell It is assumed that the deformations will be in the linear elastic range The shell displacements for a number of computed impulsive load characteristics are determined G R

A75-39224 # A theory for the calculation of conical paragliders with weak camber in supersonic flow (Eine Theorie zur Berechnung konischer Paragleiter mit schwacher Wölbung in Überschallströmung) B Wagner Darmstadt, Technische Hochschule, Fachbereich Maschinenbau, Dr.-Ing Dissertation, 1975 267 p 62 refs In German

The investigation makes use of a linearized supersonic airfoil theory to study the characteristics of paraglider operation under supersonic conditions It is pointed out that, because of the employment of the linearized theory, only small angles of attack and small camber values can be considered There is, however, no upper limit for the aspect ratio A linear integral equation for the representation of the problem is developed This equation makes it possible to use the methods of linear integral-equation theory for the analysis G R

A75-39268 Review of presently employed narrow-beam microwave antennas II (Übersicht der heute in der Technik verwendeten stark bündelnden Mikrowellenantennen II) G v Trentini (Siemens AG, Munich, West Germany) *Frequenz*, vol 29, July 1975, p 192-199 28 refs In German

Antennas with doubly curved reflectors and an unsymmetric radiation lobe are considered along with antennas with variable radiation characteristics for aircraft radar system, antennas for beam-scanning applications, multiple-beam antennas, monopulse antennas for airborne radar, and antennas with electronic beam control Attention is given to phase-controlled antennas, planar array antennas for electronic beam scanning, a cylindrical phased-array antenna for air traffic control, and array and reflector techniques for airport precision approach radars G R

A75-39321 The airship debate E Mowforth (Surrey, University, Guildford, Airfloat Transport, Ltd, England) *New Scientist*, vol 67, July 10, 1975, p 70-73

Big airships were never built in sufficient numbers either to involve sufficient capital for necessary research and development or to generate an adequate reserve of operating experience Present day airship studies are directed predominantly towards heavy freight movement, operating in competition with surface transport The Airfloat HL project which has a helium capacity of 1,342,000 cu m and is designed to carry a 500 ton payload over moderate ranges is used as a basis for discussion A study of the implications of helium heating suggests that further work be done Future airships applications lie in tasks where its peculiarities constitute an advantage over other types of aircraft, or in roles which lie entirely beyond the capacity of other aircraft or of competitive ground systems Other applications discussed, such as use in disaster relief, ranging from air-sea rescue to lifting wrecked trains or hauling emergency supplies are too costly when compared to the conventional services now in use M G

A75-39324 The choice of the MLS technique in the United States (Le choix de la technique M L S aux Etats-Unis) P Fombonne (Thomson CSF, Paris, France) *Navigation* (Paris), vol 23, July 1975, p 295-308 In French

Reasons for the choice of MLS over Doppler scanning as a new navigation technique to replace ILS are given, and the history of the making of the choice is delineated The four key questions in this controversy were developmental risks, the application of the selected technology to multiple trajectories, functional monitoring capacity, and cost considerations In addition, the French point of view and benefits to be gained by the French from the struggle in the US are discussed S J M

A75-39330 # Vibration tests of a structure with dry friction (Essais de vibration d'une structure comportant du frottement sec) R Dat, R Tretout, and J-M. Lafont (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France) *La Recherche Aéronautique*, May-June 1975, p 169 174 In French

It is shown that the application of an auxiliary high-frequency periodic excitation to reduce dry friction on a structure provides the structure with a linear behavior for any excitation at a frequency much lower than the auxiliary excitation frequency. The method is particularly useful in vibration tests of gliders and light airplanes.

S J M

A75-39331 # Introduction of unsteady separation into acceleration potential theory - Application to the helicopter (Introduction du décollement instationnaire dans la théorie du potentiel d'accélération - Application à l'hélicoptère) J J Costes (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France) *La Recherche Aéronautique*, May-June 1975, p 175-188 8 refs. In French

A means of predicting unsteady lift forces and separation on a helicopter rotor is presented. A correction is introduced into acceleration potential theory based on empirical data in order to achieve this end. Calculations are made for fixed and oscillating two-dimensional profiles, and nonlinearities in lift coefficient curves are taken into account. The method is then extended to the three-dimensional case of a finite-span wing and a rotor blade. The generalization of the linear potential theory to include unsteady separations is accomplished by replacing the incidence of an entire blade by a smaller effective incidence.

S J M

A75-39334 # The control of aircraft noise J B Large (Southampton, University, Southampton, England) *Aircraft Engineering*, vol 47, July 1975, p 4-6, 8-10, 35 15 refs

The development of noise control is reviewed from the lobed nozzles and tubular jet noise suppressors used for the first family of jet-powered aircraft to acoustic liners, current operational procedures and future technology for diminished aircraft noise. Community response can be related to noise exposure. The characteristics that combine to produce annoyance due to aircraft noise include fear, susceptibility, distance adaptability, misfeasance-preventability, and physical noise exposure. To increase community acceptance, all of the following features must be considered: noise from the aircraft, aircraft operation, land use planning in the airport neighborhood, and along the incoming and outgoing flight tracks. The noise sources discussed include jet, turbine, fan and compressor noise, shock wave shedding from the blade tips causing 'buzz saw', and the noise caused by the high by-pass ratio engine. Operational procedures aimed at noise reduction, such as two segment approach procedure must take into account a wide margin of safety.

M G

A75-39340 # Influence of rigidity and damping in an elevator control system on the longitudinal stability of an aircraft and on elevator vibrations (Wpływ sztywności i tłumienia w układzie sterowania sterem wysokości na stateczność podłużną samolotu i oscylacje steru) J Maryniak and Z Goraj (Warszawa, Politechnika, Warsaw, Poland) *Mechanika Teoretyczna i Stosowana*, vol 13, no 2, 1975, p 261-281 14 refs. In Polish

The influence of elevator stiffness, damping, and balance on aircraft stability and elevator vibrations is examined. The equations of motion for an aircraft with a vibrating elevator are derived using the Boltzmann-Hamel equations for holonomic systems. The solution is shown to reduce to a determination of the eigenvalues and corresponding eigenvectors of the matrix of state. Numerical calculations are performed for a light aircraft, and the results are compared with those obtained for an aircraft with a rigid elevator.

F G M

A75-39350 # The experimental cascade performance of NACA compressor profiles at low Reynolds number W B Roberts (Westinghouse Electric Corp., General Compressor Development Group, Sunnyvale, Calif.) *ASME, Transactions, Series A: Journal of Engineering for Power*, vol 97, July 1975, p 454-459 5 refs

A75-39351 Aerospace sandwich materials (Matériaux sandwich aérospatiaux). S Dzalba-Lydis (Société Nationale Industrielle Aérospatiale, Paris, France) *Matériaux et Techniques*, vol 63, June-July 1975, p 267-276. In French

The production of wave-shaped soldered cores for flat materials is reviewed. In particular, properties of the sandwich material known as Norsial are outlined. Various size scales and alloy compositions for the wave-shaped sandwich cores have been employed. Different machines used for manufacturing different types of undulating cores are described.

S J M

A75-39402 Structure interpretation by consideration of vibration resistance in light construction (Strukturauslegung unter Berücksichtigung der Schwingfestigkeit im Leichtbau) K Hoffer (Vereinigte Flugtechnische Werke - Fokker GmbH, Bremen, West Germany) *VDI-Z*, vol 117, no 13-14, July 1975, p 608-612. In German

The influence of notches on the cyclic stress resistance of light construction materials is investigated, and the use of mechanical preparation methods to diminish stress concentrations and improve fatigue life properties is examined. Stress corrosion cracking as a factor in these processes is also considered. It is shown that the choice of materials has much to do with cyclic loading behavior, but that high-crack-resistant materials are often more notch-sensitive than low-crack-resistant materials. Mechanical remedies to notch production include curling, extrusion, and shot peening.

S J M

A75-39482 * # Processable high temperature resistant polymer matrix materials T T Serafini (NASA, Lewis Research Center, Polymer Matrix Composites Section, Cleveland, Ohio) *Metallurgical Society of AIME, International Conference on Composite Materials, Geneva, Switzerland, Apr 7-11, 1975, and Boston, Mass., Apr 14-18, 1975, Paper 19* p 9 refs

A review is presented of studies conducted with addition-cured polyimides, giving particular attention to an improved method involving in situ polymerization of monomer reactants (PMR) on the surface of the reinforcing fibers. The studies show that the PMR approach provides a powerful method for fabricating high performance polymer matrix composites. Significant advantages of the PMR approach are related to the superior high temperature properties of the obtained material, lower cost, greater safety, and processing versatility.

G R

A75-39483 * # Metal matrix composites for aircraft propulsion systems R A Signorelli (NASA, Lewis Research Center, Cleveland, Ohio) *Metallurgical Society of AIME, International Conference on Composite Materials, Geneva, Switzerland, Apr 7-11, 1975, and Boston, Mass., Apr 14-18, 1975, Paper 23* p 26 refs

A report is presented of the current status of development of five materials which might be used in the design of components for advanced aircraft propulsion systems. Boron fiber/aluminum, boron fiber/titanium, and silicon carbide fiber/titanium composites are considered for lightweight compressor fan blades. Directionally solidified eutectic superalloy and tungsten wire/superalloy composites could possibly be used in the design of turbine blades for operational temperatures as high as 1100 C.

A75-39491 * # Simultaneous calculation of aircraft design loads and structural member sizes G L Giles (NASA, Langley Research Center, Structures and Dynamics Div., Hampton, Va.) and L A McCullers (LTV Aerospace Corp., Hampton, Va.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-965* 10 p 16 refs

A design process which accounts for the interaction between aerodynamic loads and changes in member sizes during sizing of aircraft structures is described. A simultaneous iteration procedure is used wherein both design loads and member sizes are updated during

each cycle yielding converged, compatible loads and member sizes. A description is also given of a system of programs which incorporates this process using lifting surface theory to calculate aerodynamic pressure distributions, using a finite-element method for structural analysis, and using a fully stressed design technique to size structural members. This system is tailored to perform the entire process with computational efficiency in a single computer run so that it can be used effectively during preliminary design. Selected results, considering maneuver, taxi, and fatigue design conditions, are presented to illustrate convergence characteristics of this iterative procedure.

A75-39492 # The concept of an interactive graphic design system /IGDS/ with distributed computing. C W Klomp, R A Gern, and W W Braithwaite (Boeing Commercial Airplane Co., Seattle, Wash.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-966* 9 p 7 refs

The subject system is a distributed two- and three-dimensional interactive graphics system. Its prime elements are minicomputer subsystems on which design construction, editing, manipulation, and verification are performed in support of the aerospace vehicle design process. These subsystems are tailored to specific departmental requirements and, hence, are configured to support explicit needs. Such configuring permits the incorporation of whatever graphic medium is required (storage tubes, refresh tubes, flatbed, or drum plotters). Each subsystem represents a node in a network consisting of many such graphic subsystems, nongraphic subsystems, and a number of large-scale mainframes for providing additional processing power and the management of shared data bases. This paper explains why this approach was chosen rather than an approach utilizing a single mainframe on which all activities are performed. In addition, a number of applications are presented and the inherent flexibility of the approach, as well as expansion or retraction capabilities, are discussed.

A75-39493 # Test results on computer graphics productivity for aircraft design and fabrication. A Feder (Northrop Corp., Aircraft Div., Hawthorne, Calif.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-967* 11 p

An experiment performed to determine the feasibility and advantages of CADAM (computer-augmented design and manufacturing) is described. A cathode-ray tube (CRT) refresh system and a CRT storage system are recommended on the basis of the results. Productivity ratios were as high as 17/1 compared with manual methods. Productivity ratios were obtained from design experts and trainees by applying a normalizing learning curve and a consistent 15% factor to account for computer downtime and other operating inefficiencies.

A75-39494 # C-5A air launch of Minuteman I missile. J E Leger (USAF, Aeronautical Systems Div., Wright-Patterson AFB, Ohio) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-969* 9 p

This paper discusses the general engineering-approach used to adapt existing cargo handling ground equipment, aircraft on-board cargo subsystems, and previously developed airdrop hardware, toward accomplishing an aerial launch of the Minuteman I ICBM from a C-5A cargo aircraft. The test objectives were to demonstrate the feasibility of an air mobile concept for standoff capability of strategic missiles and to provide empirical data for further derivations and assessments on aircraft response and stability, missile trajectories, and various subsystem performance. Specific identification and ranking of risk and problem areas regarding extraction, aircraft to missile separation, and missile stability become material contributions to deployment concept formulation for the M-X ICBM. The overall test effort involved analysis of airdrop technology and

assessment of system interface areas related to ground loading requirements, flight safety, and the missile air launch.

A75-39496 # Parallelism in commercial and military use of simulation. R D McLure (American Airlines, Inc., Fort Worth, Tex.) and H A Kottmann (USAF, Aeronautical Systems Div., Wright-Patterson AFB, Ohio) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-971* 11 p

The paper addresses the Commercial Airline and Military utilization of simulation systems in initial and continuation pilot training. The paper will also briefly explore the technology and philosophy associated with growth and the utilization of simulation. The specific topic will be the relationship of the growth of simulator utilization and reduction in flight training hours, the investment cost and cost savings, and the period of time involved. The Commercial Airline portion will emphasize the use of the Systems Approach to training. The Military portion will emphasize combat simulation stressing such programs as the Simulator for Air-to-Air Combat (SAAC) and the Advanced Simulator for Undergraduate Pilot Training (ASUPT). The portion dealing with the Commercial Airline will stress what has been achieved by the Airlines while the Military portion will define the potential increased use of simulation by the Air Force.

A75-39500 # In-flight simulation of the light weight fighters. G W Hall and R P Harper, Jr (Calspan Corp., Buffalo, N.Y.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-985* 8 p USAF-supported research

The USAF/Calspan variable stability NT-33A airplane was used to simulate both the General Dynamics YF-16 and the Northrop YF-17 Light Weight Fighter prototypes prior to their first flights. The YF-16 in-flight simulation showed that the side stick control system would be too sensitive with the original control gearings. This conclusion was borne out in the early flight test phase when reduced control system gearings were incorporated in the YF-16. The YF-17 in-flight simulation showed degraded handling qualities in the landing approach due to low frequency control system roots in the longitudinal Control Augmentation System. Control system modifications were proposed, implemented and evaluated in the NT-33A and a much improved longitudinal control system was incorporated in the YF-17 prior to its first flight. The two simulation programs clearly demonstrate the advantages to be gained through use of in-flight simulation for engineering design and pilot training or familiarization.

A75-39501 # Northrop YF-17 ground testing and simulation. J T Gallagher and R Merriman (Northrop Corp., Hawthorne, Calif.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-986* 6 p

The Flight Control Test Stand (FCTS) is one of the engineering tools used in the flight control system development of the Northrop YF-17 airplane. The FCTS is a functional simulator of the airplane involving mechanical, hydraulic, electrical and electronic systems. The systems are the same as those used on the airplane. In its fundamental mode the FCTS is used to qualify and life test the flight control system. In its ancillary mode it is used as a fixed base simulator to investigate flight control system performance and as a test bed for control system modifications. This paper describes the FCTS and its use in the testing and qualification of the YF-17 flight control system. The application of the FCTS in the system development of the Control Augmentation System and in particular the failure management system is discussed. Examples are presented of the supporting role played by the FCTS during the flight test development of the YF-17 prototype airplane.

A75-39502 * # Ride-quality testing under controlled flight conditions. W E Schoonover, Jr (NASA, Langley Research Center,

Hampton, Va) and J Dittenhauser (Calspan Corp., Buffalo, N Y) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-987* 10 p 6 refs

As part of a NASA program to develop the technology of ride quality, a flight test program has been conducted to obtain subjective reactions of a significant number of test passengers to a variety of controlled and repeatable flight conditions. For these experiments, the computer of a variable-stability research aircraft was programmed to precisely control the aircraft's in-flight motions as specified by motion command signals prerecorded on magnetic tape. Problems initially encountered derived primarily from the quality of the motion command signals and tape playback device, plus the aircraft motion response in degrees of freedom other than that desired. Problem solutions were obtained through the use of filtering and compensating networks. The variable-stability-system modifications, problems encountered, and their solutions are described. The test procedure is described and sample results are presented which illustrate the usefulness of this technique for ride-quality research.

A75-39503 # Northrop/United States Air Force F-5E Aircraft Fatigue Structural Integrity Program S R Murnane (Northrop Corp., Hawthorne, Calif) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-988* 7 p

A comprehensive fatigue test program relative to the airframe structure of the Northrop F-5E air superiority fighter is described. The primary objectives of the program are to locate critical areas, realize early improvements at relatively low cost, and to develop scheduled inspection and modification procedures that would minimize unscheduled structural maintenance. The fatigue program is discussed as to load spectra and loading sequence development, a complete airframe flight-by-flight fatigue test, and a counting accelerometer/service loads recording program. Test results indicate that the primary airframe components meet all strength requirements so that the F-5E aircraft is able to meet and surpass the original design objectives of the aircraft structural integrity program. A75-39504 # The C-5A active load alleviation system T E Disney (Lockheed-Georgia Co., Marietta, Ga) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-991* 9 p 13 refs

Several forms of wing load reduction systems have been investigated for use on the C-5A for the purpose of reducing static loads and/or improving the fatigue life of the wing. A fully active maneuver and gust load reduction system has been developed and flight tested and will be incorporated on the C-5A force beginning in late 1975. This system was developed for the specific purpose of providing a significant wing fatigue life improvement through reduction of maneuver and gust induced incremental wing bending moments. This paper reviews the evolution of the present load alleviation system designated as ALDCS for Active Lift Distribution Control System and presents a brief description of the system and a simplified functional block diagram. Comparisons of analytical and flight test measured maneuver and continuous turbulence loads are shown. The effects of loads changes on fatigue damage rate predictions are discussed with particular emphasis on the implications of multiple load component changes, i.e., reduced bending moments and increased torsional moments.

A75-39505 * # Augmentation of vortex lift by spanwise blowing J F Campbell (NASA, Langley Research Center, Subsonic Transonic Aerodynamics Div., Hampton, Va) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-993* 10 p 19 refs

An investigation has been conducted to evaluate the aerodynamic effects associated with blowing a jet spanwise over a wing's

upper surface in a direction parallel to the leading edge. Experimental pressure and force data were obtained on wings with sweep angles of 30 and 45 degrees and showed that spanwise blowing aids in the formation and control of the leading-edge vortex and, hence, significantly improves the aerodynamic characteristics at high angles of attack. Full vortex section lift is achieved at the inboard span station with a small blowing rate, but successively higher blowing rates are necessary to attain the full vortex-lift level at increased span distances. Spanwise blowing generates large increases in lift at high angles of attack, improves the drag polars, and extends the linear pitching moment to high lifts.

(Author)

A75-39506 # A large-scale low-speed tunnel test of a canard configuration with spanwise blowing M W M Jenkins and R T Meyer (Lockheed Georgia Co., Marietta, Ga) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-994* 10 p. Research supported by the Lockheed-Georgia Independent Development Funds

A half scale, modified JetStar, semi-span model was tested in a low speed wind tunnel. Two different size canards were tested at two positions on the fuselage. Spanwise blowing on the canards was varied over a nozzle blowing coefficient range from 0 to 1.0. Lift, drag, pitching and rolling moments were recorded during approximately 80 hours of testing. A favorable total lift interference was measured for both canard positions with the aft, large canard exhibiting the larger values. Stall angles of the complete model were increased up to 10 deg. Significant nose-up pitching moments result from the canard lift at angles of attack below wing-alone stall. Above wing-alone stall, the pitching moment remained essentially constant.

(Author)

A75-39507 * # Effects of wing bend on the aerodynamic characteristics of a low aspect ratio oblique wing E J Hopkins (NASA, Ames Research Center, Moffett Field, Calif) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-995* 6 p 10 refs

Static longitudinal and lateral/directional force and moment results are presented for an elliptical oblique wing (aspect ratio 6) mounted on top of a body of revolution. The wing was tested at various sweep angles ranging from 0 to 60 deg throughout a Mach number range of 0.6 to 1.4. Increasing the upward bend along the wing span resulted in no significant improvement in the linearity of the moment curves, but required an impractical wing pivot location to eliminate the rolling moments at low lift. Linear theory gave satisfactory predictions of the lift and moment-curve slopes at low lift.

(Author)

A75-39508 * # Estimation of transonic aircraft aerodynamics to high angles of attack J A Axelson (NASA, Ames Research Center, Moffett Field, Calif) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-996* 10 p 23 refs

A recently developed method for estimating transonic aircraft aerodynamics to high angles of attack which is especially suited to computerized aircraft design and optimization studies is described. Following theoretical and empirical guidelines, explicit nonlinear equations are formulated for subsonic, transonic, and supersonic speeds, new algorithms are used for assessing compressibility effects and for analyzing transonic, shock-dominated flows which adhere to Latone's limit Mach-number criterion. Viscous dominated flows are not analyzed. The transonic influence of viscosity is indirectly accommodated by assigning designated inputs rather than extracted solutions for the chordwise locations of shock and separation. The method is extended to complete aircraft configurations by including accounts for nose lift, the wing downwash field, and tail lift. Several comparisons of experiment and estimate are included.

A75-39509 # Composites technology - Threshold to low cost aircraft structures F Cherry (USAF, Materials Laboratory, Wright-Patterson AFB, Ohio) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-1006* 12 p 6 refs

The use of composite materials in aircraft structural applications to provide a lightweight airframe have been demonstrated in numerous engineering studies and development programs. Numerous successful commitments have been made to utilize composite materials on production aircraft such as the F-14, F-15, and F-16. Because of the high cost of composite materials these commitments were limited to the high weight sensitivity areas of these aircraft principally the empennage structure. The broader acceptance of composite materials will depend on lowering production cost and successful service experience. Programs to develop low cost composite structures are underway and the composites applications on the F-14 and F-15 are now in service and performing adequately. These programs, to develop low cost composite structures, will be described and current status will be reviewed. (Author)

A75-39511 # Divergence elimination with advanced composites N J Krone, Jr (USAF, Systems Command, Andrews AFB, Md) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-1009* 7 p 5 refs

The use of swept-forward airfoils has generally been ruled out due to the aeroelastic phenomenon known as divergence. With the advent of advanced composite materials, a new capability (material tailoring) has been added to the structural field. The purpose of this paper is to demonstrate that by tailoring the composite material properly, the structural weight penalty normally associated with divergence prevention can be greatly reduced. To accomplish this a comparison is made of wing designs of various sweep angles. The minimum weight for each sweep angle is determined through an optimization procedure. (Author)

A75-39513 # High-performance jet-V/STOL development J E Waesche and D Midgal (Grumman Aerospace Corp., Advanced Systems Technology Div., Bethpage, NY) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-1013* 12 p 14 refs

Dispersed force requirements for future Naval and land forces have led to studies of V/STOL aircraft with marked speed and payload advantages over the Harrier. These studies indicate that, for strike/fighter missions, the lightest weight and lowest cost aircraft is one powered by a lift/cruise propulsion system, properly sized for high-speed missions, supplemented by a high-thrust/weight ratio lift-producing device (e.g., lift engine). This type of aircraft introduces challenging design problems. Some of Grumman's recent technology developments aimed at solving these problems are discussed in the key areas of aircraft/propulsion design, V/STOL aerodynamics, hot-gas effects, and control concepts. (Author)

A75-39514 # Analysis of response requirements for V/STOL lift/cruise engines used to provide height and moment control J W Clark, Jr (U S Naval Material Command, Naval Air Development Center, Warminster, Pa) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-1014* 12 p 6 refs Navy Task A3303300/001C/

This paper describes a parametric investigation which was performed to determine what constraints, if any, are imposed by handling qualities requirements on a V/STOL lift/cruise propulsion system when it is used to provide vehicle moment control. Primary emphasis was placed on defining the magnitude of engine response time and incremental thrust necessary to satisfy the applicable requirements of the V/STOL Flying Qualities Specification, MIL-F-83300. A general lift plus lift/cruise configuration in the 30,000 pound gross weight class was used as the baseline aircraft model in the analysis. Effect of nozzle location, relative proportion of lift and

lift/cruise engine control power, control sensitivity, auxiliary reaction control system (RCS) power, and basic control system mode were evaluated. (Author)

A75-39515 # Aircraft altitude emissions - Fundamental concepts and future R & D requirements W S Blazowski (USAF, Aero-Propulsion Laboratory, Wright-Patterson AFB, Ohio) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-1017* 20 p 47 refs

Recently announced findings of the Climatic Impact Assessment Program recommend an accelerated combustion research effort aimed at substantial reductions in aircraft NOx emission. This paper is intended to summarize current understanding of pollutant formation fundamentals and to identify areas where further efforts are required. The roles of chemical kinetics, gas dynamics, and turbulence are discussed along with their relationship to burner design characteristics. Influences of these fundamental processes on emission characteristics and combustor control concepts are briefly reviewed. Fundamental topics which require further investigation and necessary exploratory development tasks are identified. New concepts such as catalytic combustion are also found to require much study, but seem to hold the greatest promise for very significant NOx reduction. (Author)

A75-39516 * # Jet aircraft emissions during cruise - Present and future J S Grobman (NASA, Lewis Research Center, Cleveland, Ohio) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-1018* 12 p 17 refs

Forecasts of engine exhaust emissions that may be practicably achievable for future commercial aircraft operating at high altitude cruise conditions are compared to cruise emissions for present day aircraft. These results summarize jet aircraft emissions studies reported in the Climatic Impact Assessment Program (CIAP) Monograph 2 'Propulsion Effluents in the Stratosphere'. The forecasts are based on (1) knowledge of emission characteristics of combustors and augmentors, (2) combustion research in emission reduction technology, and (3) trends in projected engine designs for advanced subsonic or supersonic commercial aircraft. Recent progress that has been made in the evolution of emissions reduction technology will be discussed. (Author)

A75-39520 # Flutter investigations on a combat aircraft with a command and stability augmentation system A Lotze, O Sensburg, and M Kuhn (Messerschmitt-Bolkow Blohm GmbH, Munich, West Germany) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-1025* 13 p 14 refs

An analytical approach to the avoidance of instabilities in a sweepable-wing combat aircraft by means of an improved control system is presented. Based on a ground resonance survey, the elastic structure of the craft is described by normal modes, results of open- and closed-loop calculations are given in Nyquist and common flutter plots and compared with flight test data. S J M

A75-39522 # YC-14 flight control A H Lee (Boeing Co., Seattle, Wash) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-1027* 11 p 8 refs

The YC-14 is the Boeing entry in the USAF Advanced Medium STOL Transport (AMST) program. The task of operating a large jet aircraft into and out of a semi-prepared, 2,000 feet long airstrip with a 27,000 pound payload presents an unusual flight control challenge. The YC-14 answers this challenge using an advanced flight control system that includes digital computers. Excellent STOL flying qualities have been achieved through control wheel steering and speed hold modes. Fail operational, fail safe performance is provided.

by a triplex flight control system. Aircraft dynamics following an engine failure are docile and do not require immediate pilot attention or unusual skill. The superior capability of digital computers to perform logic functions enables a comprehensive, semi-automated, preflight test. Failures are detected and identified to the Line Replaceable Unit (LRU). The YC-14's use of redundant digital computers in the flight control role is a first for an aircraft designed to demonstrate operational use. (Author)

A75-39523 # Lateral-directional stability augmentation methods for the STOL flight regime A Campbell and M Abramowitz (Douglas Aircraft Co., Long Beach, Calif.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-1028* 6 p

A yaw axis augmentation system based on sideslip angle and sideslip angle rate is shown to provide superior characteristics for STOL operations when compared to a conventional yaw rate damper, turn coordination system. This type of rudder augmentation system when operated in conjunction with an attitude command/attitude hold system in the roll axis can provide substantial suppression of aircraft motion transients in engine failure situations. A method is proposed for mechanizing a 'Beta Command' configuration which will allow the pilot to execute a STOL type approach in crosswind conditions with reduced workload and improved precision. (Author)

A75-39524 * # Application of active control technology to aircraft ride smoothing I D Jacobson and M Lapins (Virginia, University, Charlottesville, Va.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-1029* 10 p 5 refs Grant No NGR-47-005-202

Prototype Ride Smoothing System (RSSs) were synthesized for flight testing aboard the National Aeronautics and Space Administration General Purpose Airborne Simulator (GPAS). The systems were designed to meet comprehensive criteria including passenger comfort and aircraft handling qualities considerations. System performance estimates based on analytic expressions were compared to estimates derived from digital calculations. The effect of RSSs on pilot workload during ILS approach in turbulence was examined in a fixed-base simulator. A limited number of flights were conducted to verify predicted RSS performance. Results of these experiments indicate that RSSs reduce pilot workload and increase passenger comfort while maintaining handling qualities. (Author)

A75-39526 # F-15 flight flutter testing - Aircraft systems and test operations D E Nash, H Katz, and W C Moody (McDonnell Aircraft Co., St Louis, Mo.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-1031* 9 p

The F-15 flight flutter test aircraft and its operation are described. The existing flight control system, with relatively minor modifications, was used to excite the aircraft modes of interest. An aircraft instrumentation system was installed to measure aircraft response to this excitation. These measured data were simultaneously recorded onboard and telemetered to the ground. On-ground and in-flight test operations are discussed, including operational problems encountered and their solution. (Author)

A75-39527 # MRCA flight flutter testing D K Potter (British Aircraft Corp., Ltd., Preston, Lancs., England) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-1033* 6 p

Flight flutter testing of MRCA has been carried out at maximum wing sweep up to maximum achievable speed at minimum safe altitude, tests at higher Mach Numbers at altitude and at intermediate wing sweep angles are currently in hand. The airborne test equipment, analysis technique and test procedures are described. A brief description is given of intended flutter testing of external stores. (Author)

A75-39528 # Performance compatibility and flight testing of B-52 CCV systems G E Hodges and J R McKenzie (Boeing Co., Wichita, Kan.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-1035* 11 p 10 refs Contract No F33615-71-C-1926

As active flight control technology is applied to the design of future aircraft, compatibility and flight testing of multiple CCV systems becomes increasingly important. Compatibility of such systems has been successfully tested on a B-52 test airplane. These systems are known as Control Configured Vehicles (CCV) systems. A design and flight test program demonstrating the benefits of applying advanced flight control technology to large flexible airplanes was conducted by the Wichita Division of The Boeing Company under the sponsorship of the Air Force Flight Dynamics Laboratory. Performance objectives of the B-52 CCV program were to extend the airplane flutter envelope, improve ride, reduce wing root bending moment during maneuvers, provide adequate flying qualities for a reduced static stability configuration and demonstrate performance compatibility of all CCV systems. This paper is limited to presenting the analysis, flight test results, and a comparison of flight test results to analysis, with multiple CCV systems operating. Flight demonstration was a significant and necessary step in the acceptance of multiple CCV concepts for incorporation into future aircraft design. (Author)

A75-39529 * # Design study of structural concepts for an arrow-wing supersonic-cruise aircraft I F Sakata, G W Davis (Lockheed-California Co., Burbank, Calif.), J C Robinson, and E C Yates, Jr (NASA, Langley Research Center, Hampton, Va.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-1037* 13 p Contract No NAS1-12288

An analytical study was performed to determine the best structural approach for design of primary wing and fuselage structure of a Mach number 2.7 arrow-wing supersonic cruise aircraft. Concepts were evaluated considering near-term start-of-design. Emphasis was placed on the complex interactions between thermal stress, static aeroelasticity, flutter, fatigue and fail-safe design, static and dynamic loads, and the effects of variations in structural arrangements, concepts and materials on these interactions. Results indicate that a hybrid wing structure incorporating low-profile convex beaded and honeycomb sandwich surface panels of titanium alloy 6Al-4V were the most efficient. The substructure includes titanium alloy spar caps reinforced with Boron-polyimide composites. The fuselage shell is a closed-hat stiffened skin and frame construction of titanium alloy 6Al-4V. This paper presents an executive summary of the study effort, and includes a discussion of the overall study logic, design philosophy and interaction between the analytical methods for supersonic cruise aircraft design. (Author)

A75-39530 * # Application of an advanced computerized structural design system to an arrow-wing supersonic cruise aircraft J C Robinson, E C Yates, Jr (NASA, Langley Research Center, Hampton, Va.), M J Turner, and D L Grande (Boeing Commercial Airplane Co., Seattle, Wash.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-1038* 12 p 19 refs

A structural design study of an arrow-wing supersonic cruise aircraft has been made using the integrated design system, ATLAS, and a relatively large analytical finite-element model containing 8500 degrees of freedom. This paper focuses on structural design methods developed and used in support of the study with emphasis on aeroelasticity. The use of ATLAS permitted (1) automatic resizing of the wing structure for multiple load conditions, (2) rapid evaluation of aeroelastic effects, and (3) an iterative approach to the correction of flutter deficiencies. The significant results of the study are discussed along with the advantages derived from the use of an advanced structural design system in preliminary design studies. (Author)

A75-39531 * # Joint USAF/NASA hypersonic research aircraft study F S Kirkham, R A Jones (NASA, Langley Research Center, Hampton, Va.), M L Buck, and W P Zima (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-1039* 10 p

A joint USAF/NASA study has developed a conceptual design for a new high speed research airplane (X-24C) and identified candidate flight research experiments in the Mach 3 to 6 speed range. Four major categories of high priority research experiments are described as well as the X-24C design concept. The vehicle, a rocket-boosted, delta planform aircraft, is air launched from a B-52 and is capable of forty seconds of rocket cruise at Mach 6 with a research scramjet. Research provisions include a dedicated 10-foot long research experiments section, removable fins and strakes, and provisions for testing integrated airbreathing propulsion systems.

(Author)

A75-39532 # Propulsion system configuration development for the B-1 strategic bomber L L Christensen (Rockwell International Corp., Los Angeles, Calif.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-1040* 12 p

Penetration to targets can be accomplished two ways with the B-1: extremely low altitude at nearly the speed of sound, or high altitude at supersonic speeds. This multimission requirement was a major factor in determining its engine size and selecting its air induction system arrangement. Other factors included long subsonic and supersonic range and short takeoff distance. Based on these requirements, design trade studies were performed for selecting and sizing the propulsion system elements. The propulsion system consists of two under-wing dual nacelles, each containing two GE F101 augmented turbofan engines. Individual external compression inlets with variable geometry were selected, along with convergent-divergent, variable-area exhaust nozzles. Midway in the program, the inlet was changed from a mixed-compression to an all-external-compression type. The wind tunnel development program for the inlet and the nozzle-afterbody has been completed and is summarized. The effect of the installation losses on specific fuel consumption (SFC) is shown for representative subsonic and supersonic conditions.

(Author)

A75-39533 # F-15 propulsion system design and development H Sams (McDonnell Aircraft Co., St. Louis, Mo.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-1042* 12 p 8 refs

Considerations leading to the design and development of the highly-efficient propulsion system for the Air Force F-15 are reviewed in this paper. These considerations involved the inlet, engine, and nozzle/afterbody and their mutual interactions and integrated system performance. The propulsion system elements were systematically analyzed, designed, and developed to achieve high performance. Trade studies were conducted to select the inlet design, the engine cycle, and the nozzle/afterbody configuration. Integration of these elements into a total propulsion system/airframe was guided by data from extensive analyses and wind tunnel tests. As additional wind tunnel, ground, and flight test data became available, design refinements were made to the inlet, engine and nozzle/afterbody.

A75-39539 # F-15 propulsion flight testing experience E I Staley (McDonnell Aircraft Co., St. Louis, Mo.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-1052* 10 p

The flight test program to develop the F100 engine and F-15 inlet system is presented. The techniques to define the engine operating envelopes including airstarts, engine handling and afterburner handling are described. The method utilized to test the two-dimensional, variable capture area engine inlet duct system is

described. To accomplish the goals of the flight test program, unique instrumentation and test articles were manufactured. These items are described and their impact on the flight test program is evaluated. The flight test program presented herein successfully accomplished all the goals envisioned at its inception within a very limited time period.

A75-39824 Probabilistic design and structural fatigue F H Hooke (Department of Supply, Aeronautical Research Laboratories, Melbourne, Australia) *Aeronautical Journal*, vol 79, June 1975, p 267-273 10 refs

Aspects concerning the general problem of random loading and random strength are considered along with the characteristics of the aircraft structural loading envelope and questions regarding the design of a structure of well-balanced strength. In cases in which the detection of the onset of fatigue failure in a structure is not possible, a safe working life is predicted from a knowledge of the intended load history and from the results of life tests on other structures. Attention is also given to the case of the fail-safe or inspectable structure.

A75-39857 # Downwash during supersonic flow about a plate (Skos potoka pri sverkhzvukovom obtekanii plastiny) T I Ovchinnikova and R M Golubitskaia *Leningradskii Universitet, Vestnik, Matematika, Mekhanika, Astronomiia*, Apr 1975, p 104-109. In Russian.

The deflection angle of a supersonic flow about a plate is determined from the pressure-equilibrium condition along the slip line as a function of the Mach number of the oncoming stream and the angle of attack. Flow perturbations are presented in the form of expansion series through the velocity pitch angle in relation to the direction of the unperturbed flow. It is shown that the deflection angle of a supersonic stream behind the trailing edge of a plate for small angles of attack is proportional to the cube of the angle of attack.

A75-39923 Is there an airship in your future J F Vittek, Jr (MIT, Cambridge, Mass.) *Technology Review*, vol 77, July-Aug 1975, p 23-29

The possibilities for a reemergence of airships in the transportation systems of the future are examined, taking into account special advantages which airships could offer, economic factors, and certain operational difficulties. It is found that for a number of applications a use of airship might very well have economic advantages compared to an employment of other means of transportation. An actual prediction of the cost of airship service cannot be provided because of the absence of actual operational cost data. It is concluded that at the moment the chances for a rebirth of the airship are not very good because of the risk which is inherent in an investment related to the establishment of an airship transportation system.

A75-39981 # The structure of high-pressure jets of low density issuing from a supersonic nozzle (O strukture vysokonapornykh strui nizkoii plotnosti za sverkhzvukovym soplom) N I Kisiakov, A K Rebrov, and R G Sharafutdinov *PMTF - Zhurnal Prikladnoi Mekhaniki i Tekhnicheskoi Fiziki*, Mar-Apr 1975, p 42-52 21 refs. In Russian.

Experimental study of the structure of N₂ and CO₂ jets for a wide range of nozzle exit to ambient pressure ratios and Reynolds numbers. A low-density gasdynamic apparatus with combined booster and cryogenic vacuum pumps was used in the experiments. The study of the low-density jets was based on density measurements and visualization of the flow diagram with the aid of an electron beam. The following regimes were studied: (1) variable pressure ratio at constant CO₂ flow rate, (2) variable CO₂ flow rate at constant pressure ratio, and (3) N₂ experiments at constant values of the complex Re characterizing the effect of viscosity in all jet regions. The effect of condensation was studied for both N₂ and CO₂ flows, while the effect of temperature was studied in the N₂ jet only. Jet structure in the Mach disk region and in the X-shaped configuration was investigated.

A75-40174 # Operational reliability of aircraft wheels (Ekspluatatsionnaya nadezhnost' aviatsionnykh koles) I I Khasanov, R V Sakach, Ia N Peiko, S S Kokonin, and V V Mozalev. Moscow, Izdatel'stvo Transport, 1974 224 p 73 refs In Russian

The present work discusses the major aspects of reliability of aircraft wheels in service. The main design features of landing devices (undercarriages, wheels, and brakes) of Soviet and foreign construction are described. The characteristics of current pneumatic tires for use in reliable service are examined. The load capacity of aircraft wheels is discussed along with means of enhancing lifetime and reliability as a result of mechanical strengthening. Maintenance and control techniques based on actual condition of wheels in service are described. Improvement of brake units and aircraft deceleration during landing run are evaluated. S D

A75-40175 # The BSU-ZP onboard control system (Bortovaya sistema upravleniya BSU-ZP) N M Savchenko and N P Annenkov. Moscow, Izdatel'stvo Transport, 1974 244 p In Russian

The book reviews principles in the analysis of an aircraft as a control object and gives detailed descriptions of the operation, and design of several aircraft navigation and landing systems. These include an onboard system for control of landing approach (the BSU-ZP), a computer-aided pilot-navigational system for assisting center-of-gravity stabilization and guiding along a preset path, an electronic autopilot for stabilization of aircraft angular coordinates relative to the center of mass, and an automatic trimming system. Special consideration is given to a monitoring system that prevents the aircraft from entering a dangerous flight regime during failure of the BSU-ZP system by automatically switching off the defective channel and giving the pilot a signal. P T H

A75-40194 # Gyroscopes /2nd revised and enlarged edition/ (Giroscopy /2nd revised and enlarged edition/) Ia N Roitenberg. Moscow, Izdatel'stvo Nauka, 1975 592 p 140 refs In Russian

The book deals with theoretical aspects of gyroscopic instruments and devices used in airplanes, ships, and other moving objects. Theories are presented for gyroscopic verticals, gyrocompasses, force and direct gyrostabilizers, and stabilized gyroplatforms. Techniques of dynamic-systems optimization are examined in detail together with the motion of systems under the influence of random forces. Analyses are conducted for optimum phase-state estimation, the optimum filtration techniques of Kolmogorov (1941) and Wiener (1950), the theory of optimum Kalman-Bucy filters, and optimum control by systems described with stochastic differential and difference equations. F G M

A75-40198 # Design of aircraft fuel systems (Proektirovaniye toplivnykh sistem samoletov) L B Leshchiner and I E Ul'ianov. Moscow, Izdatel'stvo Mashinostroeniye, 1975 350 p 37 refs In Russian

The present work is concerned with the fundamentals of the design of aircraft fuel systems (AFS). Typical systems are examined, and effective design techniques are described for fuel feed systems, fuel transfer to service tanks, fuel tank pressurization, on-ground and in-flight fueling, and fuel tank drainage. AFS design features are discussed both on the basis of their structural and functional relations to other systems in an aircraft and according to the influence of AFS on the aerodynamic, strength, and performance characteristics of various types of aircraft. Also discussed are the properties of fuel systems at low and high temperatures and the control instrumentation of fuel systems. S D

A75-40200 The convention on international combined transport of goods - A new start also with regard to air transport (Das Ubereinkommen uber den internationalen kombinierten Guterverkehr - Ein neuer Anlauf auch im Hinblick auf die Luftbeforderung) R Ganten. *Zeitschrift fur Luft- und Weltraumrecht*, vol 24, June 1975, p 116-122 20 refs In German

A draft concerning a convention on international combined transport of goods as a basis for the discussions of the world container conference in 1972 had been submitted to the United Nations in November 1971. However, the draft was not discussed because of the diverging interests of the involved parties. It was decided to write a new draft after a thorough study of the various aspects related to the combined transport of goods. The legal questions and economic factors which will have to be considered in a convention on international combined transport of goods are discussed, giving attention also to objections which have been raised against the inclusion of air traffic in the agreement. G R

A75-40206 Measurements in an incompressible three-dimensional turbulent boundary layer, under infinite swept-wing conditions, and comparison with theory B van den Berg, A Elsenaar, J P F Lindhout (National Aerospace Laboratory, Amsterdam, Netherlands), and P Wesseling (Technische Hogeschool Twente, Enschede, Netherlands). *Journal of Fluid Mechanics*, vol 70, July 15, 1975, p 127-148 31 refs. Research supported by the Royal Netherlands Air Force and National Agency for Aerospace Programs

First a three-dimensional turbulent boundary-layer experiment is described. An infinite swept-wing flow has been simulated with good accuracy. The initially two-dimensional boundary layer on the test plate was subjected to an adverse pressure gradient, which led to three-dimensional separation near the trailing edge of the plate. Next, a calculation method for three-dimensional turbulent boundary layers is discussed. This solves the boundary-layer equations numerically by finite differences. The turbulent shear stress is obtained from a generalized version of Bradshaw's two-dimensional turbulent shear stress equation. The results of the calculations are compared with those of the experiment. Agreement is good over a considerable distance, but large discrepancies are apparent near the separation line. (Author)

A75-40254 # Calculation of supersonic inviscid flow about a pyramidal-body model of a delta-shaped vehicle (Raschet sverkhzvukovogo neviaskogo techeniya u piramidal'nogo tela, modeliruiushchego del'tovidnyy letatel'nyy apparat) A P Kosykh and A N Minaïlov. *Akademiya Nauk SSSR, Izvestiya, Mekhanika Zhidkosti i Gaza*, May-June 1975, p 105-111 21 refs In Russian

The flow and weight characteristics of a trihedral pyramid, flying with supersonic speed at an angle of attack are investigated using a nonlinear method of direct calculation. A three-dimensional stationary analog of a finite-difference scheme of direct calculation is developed and applied in a Cartesian system of coordinates X,Y,Z. The form of the body is specified in terms of analytic functions. Its surface elements are approximated by planar components using the method of least squares. The planes cut several nonstandard volumes in the cells of the grid, and these volumes are used in the calculation together with standard cells having the form of parallelepipeds and not adjoining the body surface. M G

A75-40255 # Numerical investigation of the flow of a viscous, heat-conducting gas past a blunt body with finite dimensions (Chislennoe issledovanie techeniya viazkogo teploprovodnogo gaza i tupogo tela konechnykh razmerov) A V Babakov, O M Belotserkovskii, and L I Severinov. *Akademiya Nauk SSSR, Izvestiya, Mekhanika Zhidkosti i Gaza*, May-June 1975, p 112-123 12 refs In Russian

Study of the flow of a viscous, heat-conducting gas past a sphere, at large freestream hypersonic Mach numbers and moderate freestream Reynolds numbers, when the influence of viscosity is substantial in the entire disturbed region and the gas flow is laminar. The force and heat effects of the flow on the body are calculated, and the characteristics of the gas flow near the base region of the body are studied in detail. The influence of the Reynolds number on the sphere's drag and on the drag of the base region is shown in addition to the distribution of local friction and pressure in the base region. M G

A75-40259 # Parabolic method for solving the problem of a sonic gas flow about a thin symmetric profile (O parabolicheskom metode resheniya zadachi obtekanija tonkogo simmetrichnogo profilja zvukovym potokom gaza) V Iu Ol'shanskii and S V Fal'kovich *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, May-June 1975, p 168-171 8 refs In Russian

A75-40260 # The problem of the optimal form of lifting bodies in Newtonian flow (K zadache ob optimal'noi forme nesushchikh tel v N'utonovskom potoke) E I Filatov *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, May-June 1975, p 171-174 In Russian

The upper and lower surfaces of a body having blunt leading edges and exhibiting maximum aerodynamic performance at hypersonic speed are investigated using the Ritz method. The exact shapes of upper and lower surfaces are specified for maximum aerodynamic performance. The drag of the leading edges is found not to have significant influence on the performance of optimum bodies. M G

A75-40405 # Remarks on approximate conformal representation of biplane wing sections W J Prosnak (Warszawa, Politechnika, Warsaw, Poland) *Académie Polonaise des Sciences, Bulletin, Série des Sciences Techniques*, vol 23, no 2, 1975, p 7 (161)-19 (173) Research supported by the Instytut Lotnictwa

A normalization of a mapping function representing approximately a given biplane wing section is considered. The normalization modifies the function in such a manner that after the modification, the leading and trailing edges of profiles of the approximate biplane wing section coincide with those of the profiles of the given biplane wing section. Construction of a first approximation to the mapping function which fulfills this condition is presented. The construction is based on two mapping functions, representing each of the profiles of a given biplane section separately. Three numerical examples of such a first approximation are given. (Author)

A75-40475 F-16 - First with fly-by-wire C E Wise *Machine Design*, vol 47, Aug 7, 1975, p 16-18, 20, 21

An American aerospace corporation has been selected by the Air Force to build the F-16 fighter aircraft. The electronic equipment of the F-16 includes a fly-by wire (FBW) flight-control system. An unstable aircraft design concept was adopted for the aircraft as a means to reduce drag. Operational and design details of the FBW system are discussed along with questions related to the use of a side-stick controller in the aircraft. G R

A75-40501 * Challenges of short-haul air transportation T L Galloway (NASA, Ames Research Center, Moffett, Field, Calif) and J A Stern (Douglas Aircraft Co., Long Beach, Calif) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn., May 6-8, 1975, Paper 750586* 17 p NASA supported research

Short-haul transportation systems are characterized by low average utilization, high peak but low average passenger demand, severe competition from other transportation modes, high fixed costs and high operating costs. Studies were conducted to analyze the operational requirements and market size for medium-density air transportation. The determination of the aircraft that will most efficiently meet the requirements of this market requires the careful evaluation of variable parameters such as engine cycles, payload, field length range and type of high-lift system. Low noise, low cost and thrust reversing capability are the basic criteria for the propulsion system. It is concluded that aircraft of less than 50-seat capacity cannot generate satisfactory profits operating in the medium density market. M G

A75-40502 * Design of short haul aircraft for fuel conservation M K Bowden, H S Sweet (Lockheed Georgia Co., Marietta, Ga.), and M H Waters (NASA, Ames Research Center, Moffett Field, Calif) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn., May 6-8, 1975, Paper 750587* 16 p 6 refs

Current jet fuel prices of twice the 1972 level have significantly changed the characteristics of airplane design for best economy. The results of a contract with the NASA Ames Advanced Concepts and Missions Division confirmed the economic desirability of lower design cruise speeds and higher aspect ratio wings compared to designs developed in the by-gone era of low fuel price. Evaluation of potential fuel conservation for short-haul aircraft showed that an interaction of airfoil technology and desirable engine characteristics is important. The supercritical airfoil permits higher aspect ratio wings with lower sweep, these, in turn, lower the cruise thrust requirements so that engines with higher bypass ratios are better matched in terms of lapse rate, lower cruise speeds (which are also better for fuel and operating cost economy) push the desired bypass ratio up further. Thus, if fuel prices remain high, or rise further, striking reductions in community noise level can be achieved as a fallout in development of a 1980s airplane and engine. Analyses are presented of developmental trends in the design of short-haul aircraft with lower cruise speeds and higher aspect ratio wings, and the effects on fuel consumption of design field length, powered lift concepts, and turboprop as well as turbofan propulsion are discussed. (Author)

A75-40504 Analysis of the costs, effectiveness, and benefits of aircraft noise reduction programs H B Safeer (US Department of Transportation, Washington, D C) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn., May 6-8, 1975, Paper 750595* 8 p

Studies were performed, of 23 US airports, to analyze the costs, effectiveness, and benefits of a variety of alternative means of reducing the impact of aircraft noise, including retrofit of all JT3D and/or JT8D powered aircraft with new nacelles containing sound absorption material (SAM), modified take off and approach procedures, and acquisition of land within the NEF 40 contour. The cost effectiveness analysis provided a relative ordering of the options in terms of number of people and land area removed from the NEF 30+ and 40+ areas for the aeronautical options. The benefit cost analysis resulted in a determination of which options yielded at least a dollar's worth of benefit for the last dollar spent. The analysis of total cost, including the cost of acquiring the residual land in the NEF 40+ area, resulted in a determination of the minimum total cost option. M G

A75-40505 10 years of STOL - The Twin Otter's first decade M C W Davy and P S Martin (De Havilland Aircraft of Canada, Ltd., Downsview, Ontario, Canada) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn., May 6-8, 1975, Paper 750596* 8 p

The evolution of STOL as a means of public transport has been significantly affected by the aircraft Twin Otter and its performance during the ten years since its first flight on May 20, 1965. The success of the aircraft in the field of urban commuter service for a while overshadowed its performance as a bushplane for the Canadian north, although the aircraft had been originally designed as a replacement for the conventional bushplane. The development of alternative landing gears and the exploitation of the aircraft's STOL performance made it then possible to use Twin Otter for operations at locations denied to conventional aircraft. G R

A75-40506 Short haul transportation - The helicopter's time is now R F Daniell and R E Warren (United Aircraft Corp., Sikorsky Aircraft Div., Stratford, Conn) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn., May 6-8, 1975, Paper 750598* 10 p

An investigation concerning a utilization of the helicopter in short-haul transportation applications is considered. Obstacles to short-haul V/STOL are examined. It is concluded that the technology for building the required system has been available for years. Obstacles which have prevented the establishment of the needed transport system are related to difficulties in financing the needed developments. Specific uses of a new short-haul VTOL system are discussed. G R

A75-40507 * NASA refan program status K L Abdalla and J A Yuska (NASA, Lewis Research Center, Cleveland, Ohio) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750592* 34 p 5 refs

The objective of the refan program is to demonstrate the technical feasibility of substantially reducing the noise levels of existing JT8D powered aircraft. The program consists of the design, manufacturing and testing of the refan engines and modified nacelles and airplanes. Experimental testing has been completed for the refan engine both at sea level and at altitude conditions. Ground testing for the B727 side- and center-engine installations and flight testing of the DC-9 with refan engines and acoustic nacelles have been performed. Analyses of the test results are in progress. Preliminary results presented in this paper show that substantial noise reductions were achieved (Author)

A75-40508 Airtransit's first six months of operating the Canadian STOL demonstration service R B McCormack (Airtransit Canada, Montreal, Canada) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750599* 12 p

A complete STOL (Short Take-off and Landing) system is currently providing public transportation service between the urban centers of two large Canadian cities. Passenger and public reaction, plus operating experience in a competitive environment is providing some interesting data, useful in developing future STOL systems as an important component in the improvement of transportation in general. The Demonstration is showing that STOL systems are capable of quickly providing fast, convenient, short-haul service, while at the same time respecting the composite concerns of society, encompassing air pollution, noise, land-use, energy-consumption and economics (Author)

A75-40509 Whither all weather - An airline engineer's point of view O R Evans (United Air Lines, Inc., Chicago, Ill.) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750600* 8 p 5 refs

A brief listing of major elements of the ground, airborne and other elements of the All Weather Landing System is presented. The chronology of growth in the use of this system by a major trunk airline in the last decade is reviewed. Problems considered by the author to be basic to further deployment and development of the system are discussed and tentative solutions to these problems are suggested, namely: (1) Continuous recording and public dissemination of Runway Visual Range data for all Category II and III periods at existing and proposed runways of these Categories is suggested to provide the most cost-effective basis for decisions regarding further deployment of ILS systems and MLS systems. (2) It is recommended that an industry group be convened to review and, probably, revise certification requirements for aircraft intended to operate below Category II minima in order to break the stalemate presently inhering in those activities (Author)

A75-40510 Whither all weather - An airplane manufacturer's point of view H N Tobie (Boeing Commercial Airplane Co., Renton, Wash.) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750601* 6 p

Automatic landing has been developed to the point where all the wide-bodies jets have it as basic equipment. The techniques presently employed are generally founded upon the technology of the last two decades - especially with respect to analog computation and gyroscope references. Several new techniques are now available which can substantially improve the autoland systems for the next generation of transport aircraft. These include airborne digital computers, the use of integrated air data and strapdown airplane motion reference systems, expanded use of automatic system test, and the development and employment of the Microwave Landing System (MLS). These new technology developments promise to provide expanded operational benefits, reduced maintenance, and increased availability over that of contemporary autoland systems (Author)

A75-40513 * Quiet clean short-haul experimental engine /QCSEE/ design rationale A P Adamson (General Electric Co., Fairfield, Conn.) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750605* 11 p NASA-supported research

The principal design features of the NASA QCSEE Under-The-Wing and Over-The-Wing powered lift propulsion systems are given. In the UTW engine, these include noise reduction features, a variable pitch low pressure ratio fan, a fan drive reduction gear, an advanced core and low pressure turbine with a low pollution combustor, a digital control, and advanced composite construction for the inlet, fan frame, fan exhaust duct, and variable area fan exhaust nozzle. The OTW engine is similar but has higher fan pressure and a fixed pitch fan. Both engines are scheduled to be fabricated and tested starting in 1976 (Author)

A75-40514 Installation effects on the CF6-50 in the YC-14 aircraft R K Tuten, F R Housley, and P J Hess (General Electric Co., Aircraft Engine Group, West Lynn, Mass.) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750607* 15 p

Design of the YC-14 over-the-wing nacelle, utilizing the CF6-50D engines, presented unique engine installation conditions which have been accommodated with very minor impact to the baseline commercial engine design. Major installation features which affect the engine are reviewed including engine mounting, engine/aircraft deflections and nacelle sealing, effect of the confluent-flow exhaust nozzle on engine cycle matching, and inlet/thrust reverser/engine compatibility. Design solutions and planned testing to evaluate the installation are discussed (Author)

A75-40515 * Noise reduction of EBF propulsive-lift systems J S Gibson (Lockheed-Georgia Co., Marietta, Ga.) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750608* 12 p Contract No. NAS3-16831

In a recently completed program, static and wind tunnel measurements have been made of the basic noise, noise reduction, and performance characteristics of externally blown flap (EBF) propulsive-lift systems. The static tests were performed on an outdoor model rig. Noise evaluations were made for parameters such as basic system geometry, flap slot dimension variation, elimination of flap slots, sweep angle variation, passive flap trailing edge modifications, active (blowing) trailing edge modifications, and for an ejector/decayer exhaust system. The wind tunnel evaluation determined forward speed effects on EBF systems noise characteristics. The results from the experimental programs are discussed as to their application to full scale short haul aircraft (Author)

A75-40516 * Full-scale upper-surface-blown flap noise L J Heidelberg, L Homyak, and W L Jones (NASA, Lewis Research Center, Cleveland, Ohio) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750609* 28 p 9 refs

A highly noise-suppressed TF 34 engine was used to investigate the noise of several powered lift configurations involving upper-surface-blown (USB) flaps. The configuration variables were nozzle type (i.e. slot and circular with deflector), flap chord-length, and flap angle. The results of velocity surveys at both the nozzle exit and the flap trailing edge are used for correlation of the noise data. Configurations using a long flap design were 4 dB quieter than a short flap typical of current trends in USB flap design. The lower noise for the long flap is attributed primarily to the greater velocity decay of the jet at the flap trailing edge. The full-scale data revealed substantially more quadrupole noise in the region near the deflected jet than observed in previous sub-scale tests (Author)

A75-40517 An overview of low medium density short-haul air transportation policy implementation F R Mazzitelli (Grumman Aerospace Corp., Bethpage, N Y.) *Society of Automotive Engineers,*

Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750610 8 p 13 refs

A review is presented of the national transportation policy as it specifically affects the low and medium density short-haul air transportation system. In 1971, the problem of providing air service to low density, short haul markets had been identified as the third most pressing difficulty the aviation industry faced (following noise and congestion). A low-density, short-haul program which included system concept studies and vehicle definition studies was initiated by DOT and NASA in 1972 to define technology and research goals.

A75-40518 The Spanloader advanced transport concept R H Lange (Lockheed-Georgia Co, Marietta, Ga) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750616 8 p 10 refs*

The Spanloader design involves a thick, highly swept, constant-chord wing with a center body and T-tailed empennages attached at the wing tips. Most of the cargo and fuel are stored in the wing structure in order to achieve a near-uniform distribution of internal loading to match external aerodynamic loads. Advancements in technology utilized in the Spanloader concept are related to the NASA supercritical airfoil, the principle of lift augmentation for improved airport performance, the employment of advanced filamentary composite materials in the structure, and an air-cushion landing system.

A75-40519 Maximum installed engine utilization through disciplined health monitoring H W Bart and A B Nadler (Swissair Transport Co, Ltd, Zurich Airport, Switzerland) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750612 8 p*

The engine monitoring system of a European airline is discussed, taking into account fundamental considerations regarding engine monitoring problems, economic aspects, reliability checks, and aspects of long term and short term engine monitoring. Monitoring concepts and practical examples are considered, giving attention to shop supervision, a manual trend analysis, oil analyses, visual inspection, and vibration measurements.

G R

A75-40520 Engine maintenance management program requires information L C Ellis and R H Johnson (United Air Lines, Inc, Chicago, Ill) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750613 6 p*

A review is presented of the key information requirements and techniques employed in the maintenance program of an American airline. The program contains the three primary maintenance processes of hard time (overhauls), on-condition sampling, and condition monitoring. It is pointed out that the cornerstone of any maintenance/reliability program is an effective information collection, analysis, and dissemination system. Attention is given to current information systems and plans for an improved system.

A75-40521 Future hydrogen fueled commercial transports A J K Carline (General Dynamics Corp, St Louis, Mo) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750615 12 p 6 refs*

An examination is conducted of the problems inherent in the design of future subsonic liquid hydrogen fueled transports. Attention is also given to the economic aspects of subsonic commercial transports which use liquid hydrogen as fuel. It is found that such transports are very competitive with equivalent jet fueled aircraft. It is pointed out that all economical data are very dependent on the relative price of liquid hydrogen and jet fuel.

A75-40522 Advanced supersonic transport R D FitzSimmons and R L Roensch (Douglas Aircraft Co, Long Beach, Calif) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750617 9 p 8 refs*

Comparisons are presented between the last U S SST design and results of recent progress on an advanced supersonic transport design. The results are shown of changing from a double-delta 2.7 Mach configuration to a modified arrow-wing 2.2 Mach design. Information is presented covering increased range, lower operating cost, reduced technical risk, and noise levels that meet anticipated requirements of society. The main emphasis in this paper is on an aerodynamic lift-to-drag ratio of 10 and how this high level of aerodynamic cruise efficiency can be substantiated for a tailored design.

A75-40523 Future lighter-than-air concepts J J Schneider (Boeing Vertol Co, Philadelphia, Pa) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750618 12 p*

This paper examines the lighter-than-air situation today, presents a historical overview of the airship, and discusses the possible uses for future airship concepts. Technical and operational characteristics of conventional and hybrid concepts are discussed as well as results of a parametric analysis of advanced airship concepts. Speed and cost trends of both conventional rigid and partially buoyant hybrid airship concepts are presented.

A75-40524 Design of jet engine rotors for long life S A Sattar and J T Hill (United Aircraft Corp, Pratt and Whitney Aircraft Div, East Hartford, Conn) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750619 12 p 6 refs*

An overview is provided concerning the general considerations which have to be taken into account in the design of aircraft gas turbine engine disks. Attention is given to factors assuring a long life, the vibration characteristics, and the dimensional growth limits of the rotor. The criteria which have to be satisfied for an acceptable rotor design are related to acceptable dynamics, minimal dimensional changes, the prevention of rupture due to overspeed, and the prevention of failure by low cycle fatigue.

A75-40530 * Engine design considerations for 2nd generation supersonic transports R A Howlett (United Aircraft Corp, Pratt and Whitney Aircraft Div, East Hartford, Conn) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750628 16 p 7 refs* NASA-sponsored research

The environmental and economic goals projected for advanced supersonic transports will require revolutionary improvements in propulsion systems. Variable cycle engine concepts that incorporate unique components and advanced technologies show promise in meeting these goals. Pratt & Whitney Aircraft is conducting conceptual design studies of variable cycle engine concepts under NASA sponsorship. This paper reviews some of the design considerations for these engine concepts. Emphasis is placed on jet noise abatement, reduction of emissions, performance improvements, installation considerations, hot section characteristics and control system requirements. Two representative variable cycle engine concepts that incorporate these basic design considerations are described.

A75-40531 * The NASA research program on propulsion for supersonic cruise aircraft R J Weber (NASA, Lewis Research Center, Cleveland, Ohio) *Society of Automotive Engineers, Air Transportation Meeting, Hartford, Conn, May 6-8, 1975, Paper 750629 8 p*

Since 1972 NASA has pursued a program aimed at advancing the technology and establishing a data base appropriate for the possible future development of supersonic cruise aircraft. This paper briefly reviews the objectives and status of the propulsion portion of the program. Building upon a continuing series of propulsion system studies, research activities are under way in noise and pollution reduction, inlet stability, and materials.

A75-40532 Disc failures - A cause for concern J Belson
Flight International, vol 108, July 31, 1975, p 163-166

It is pointed out that disk design has been a problem since the introduction of the gas-turbine engine with its high-energy internal rotating components. A disk fails about once every million aircraft hours. Aspects of rotor disk design and manufacture are considered along with the inspection and production control techniques used. Fatigue is the major factor affecting the service life of a disk. Current airworthiness regulations are examined and details concerning the occurrence of disk failures are discussed. Attention is also given to approaches for reducing the incidence of disk failures. G R

A75-40550 # Use of short period frequency requirements in horizontal tail sizing D J Moorhouse and M W M Jenkins (Lockheed-Georgia Co., Marietta, Ga.) *Journal of Aircraft*, vol 12, June 1975, p 560, 561

An approach is proposed for determining the aft center of gravity limit required to meet the flying qualities specification for short period dynamics. The procedure does not necessarily guarantee acceptable flying characteristics. However, the approach constitutes a rational method for calculating the aft center of gravity limit in the initial design phase of sizing the horizontal tail of a new aircraft configuration. G R

A75-40593 # Engineering calculations of gas turbine engines by the method of small deviations /3rd revised and enlarged edition/ (Inzhenernye raschety gazoturbinnikh dvigatelei metodom mal'kikh otklonenii /3rd revised and enlarged edition/) A Ia Cherkez Moscow, Izdatel'stvo Mashinostroenie, 1975 380 p 18 refs In Russian

The present work sets forth the principles of the method of small deviations in the design, testing, and final adjustment of gas turbine engines. The method provides a unified manner of expressing changes in parameters or characteristics of various engine elements under their joint operation and mutual influence. P T H

A75-40602 747 air carriage of the Space Shuttle Orbiter W G Register (Boeing Aerospace Co., Seattle, Wash.) In *Technology today for tomorrow*, Proceedings of the Twelfth Space Congress, Cocoa Beach, Fla., April 9-11, 1975. Cocoa Beach, Fla., Canaveral Council of Technical Societies, 1975, p 1-1 to 1-11

The Space Shuttle system requires a means for transport of the Orbiter vehicles to the test and launch sites. Evolutionary aspects of the program for air carriage of the Orbiter vehicle on the Boeing 747 aircraft are discussed. The 747 air carry system provides the means for conducting Orbiter approach and landing tests at Edwards Air Force Base and the air ferry of the Orbiter to the vertical launch sites. Technical and program aspects of the carrier aircraft modification to meet the requirements and objectives of the Space Shuttle Program are presented. (Author)

A75-40833 Pollution control in continuous combustion engines A H Lefebvre (Cranfield Institute of Technology, Cranfield, Beds., England) In *International Symposium on Combustion*, 15th, Tokyo, Japan, August 25-31, 1974, Proceedings. Pittsburgh, Pa., Combustion Institute, 1975, p 1169-1179, Comments, p 1179, 1180 48 refs

It is shown that the development of low emission combustors is proceeding along two main lines. The simplest and most direct approach is through various minor modifications to established hardware, e.g., by changes in liner geometry and airflow distribution and by the adoption of more sophisticated methods of fuel injection. These modifications may be supplemented, where feasible, by compressor air bleed at low power operation and water injection at high power conditions. The other approach is towards radically new concepts which involve major combustor redesign. Of these the most promising appear to be variable geometry and staged combustors,

and also 'prevap/premix' systems in which the fuel is vaporized and thoroughly mixed with all the air required for combustion upstream of the combustion zone. (Author)

A75-40860 # Impact erosion - A serious environmental threat to aircraft and missiles G F Schmitt, Jr (USAF, Materials Laboratory, Wright-Patterson AFB, Ohio) *ASME, SAE, AIAA, ASMA, and AIChE, Intersociety Conference on Environmental Systems, San Francisco, Calif., July 21-24, 1975, ASME Paper 75-ENAS-45* 11 p 5 refs. Members, \$1 00, nonmembers, \$3 00

The mechanisms of erosion on various materials and the comparative behavior of them in rain and ice environments are discussed. The influence of environmental parameters such as velocity, impingement angle and heating are also discussed. Guidelines for improvement of materials for various applications have been determined based upon research which has been conducted. The simulation facilities utilized for the research and assessment of materials capability are described. Postulated erosion requirements for advanced systems are presented based upon naturally occurring environments, simulated conditions in various apparatus, and comparative behavior with existing materials. The broad scope of the erosion problems encountered in aerospace systems has been indicated by the subjects touched on in this paper. (Author)

A75-40891 # The B-1 environmental control system P G Stein (United Aircraft Corp., Hamilton Standard Div., Windsor Locks, Conn.) and L Scheele (Rockwell International Corp., Los Angeles, Calif.) *ASME, SAE, AIAA, ASMA, and AIChE, Intersociety Conference on Environmental Systems, San Francisco, Calif., July 21-24, 1975, ASME Paper 75-ENAS-13* 7 p. Members, \$1 00, nonmembers, \$3 00

On December 23, 1974, the B-1 airplane started its flight test program with a 90-min flight from Palmdale, California. A very important part of this multi-mission aircraft is the environmental control system (ECS). This system embodies a number of important advancements while retaining the basic advantages of present operational ECS systems. Specific advantages include modular concepts, use of fuel heat sinks to reduce ECS dependence on engine bleed air, and improvements in operational reliability over present military ECS. The paper presents the basic ECS concepts used on the B-1, the advantages of this system, and some of the design considerations included in the system. The development program is discussed along with techniques utilized to permit early detection and correction of development problems prior to aircraft installation. (Author)

A75-40894 # A fluidically controlled aircraft environmental system P S Evans (AirResearch Manufacturing Company of America, Phoenix, Ariz.) and C D Campbell (AirResearch Manufacturing Company of California, Torrance, Calif.) *ASME, SAE, AIAA, ASMA, and AIChE, Intersociety Conference on Environmental Systems, San Francisco, Calif., July 21-24, 1975, ASME Paper 75-ENAS-7* 9 p. Members, \$1 00, nonmembers, \$3 00

A program entitled 'Fluidic Thermal Controls', was conducted for the United States Air Force. The primary objective was to use fluidics technology to control the cabin temperature in a typical military fighter aircraft. The fluidic components were to be used with state-of-the-art components to provide an integrated control system. The major system components that were used, such as heat exchangers, water separator, and cooling turbine, were existing parts. The program discussed included establishment of a system concept, concept analysis, fabrication of components, and testing. The system was designed to utilize a minimum of mechanical parts, while fluidic components were implemented for sensing, computation, and power output. Linear approximations to system components were used for initial analysis during system buildup. Successful testing of the system revealed that presently developed fluidic circuitry is capable of performing as required in environmental control system applications. (Author)

A75-40896 # Small gas turbine auxiliary power units C Rodgers (International Harvester Co., San Diego, Calif.) *ASME, SAE, AIAA, ASMA, and AIChE, Intersociety Conference on Environmental Systems, San Francisco, Calif., July 21-24, 1975, ASME Paper 75-ENAS-1* 22 p. Members, \$1 00, nonmembers, \$3 00

Self sufficiency for small fighter aircraft operating from remote advanced bases can be attained with small on-board auxiliary power units (APUs) supplying pneumatic power to start the main engine and for the environmental control systems. Various attributes of three candidate APU design configurations are discussed, one integral bleed and two with a separately driven high speed load compressor. Detailed examination of the candidates reveals the overall superiority of the integral bleed APU in most aspects, except for overall diameter, confirming its predominant use in most aircraft equipped with APUs. (Author)

A75-40903 # Analytical design of a monolithic wing (Ob analiticheskom proektirovani monolitnogo kryla) M A Bogomol'nyi and T K Sirazetdinov *Aviatsionnaia Tekhnika*, vol 18, no 2, 1975, p 13-18 5 refs. In Russian

The problem is discussed of designing a beveled monolithic wing of uniform cross section for such technical constraints as weight, displacements, stresses, etc. The stiffness characteristics of the wing cross-sections are controlled by varying the size of the sectional cut-outs. Numerical methods of solution are proposed, and the design of a minimum-weight wing for given stresses and deflections is demonstrated. V P

A75-40905 # Theory for calculating a wing of small aspect ratio from a discrete-continuous calculation scheme /matrix differential equation of axial displacements/ (Teoriia rascheta kryla malogo udlinienia po diskretno-kontinual'noi raschetnoi skheme /matrichnoe differentsial'noe uravnenie osevykh peremeshchenii/) M B Vakhitov and N G Larionov *Aviatsionnaia Tekhnika*, vol 18, no 2, 1975, p 25-30. In Russian

A75-40910 # Mathematical description of a wing surface (K matematicheskomu opisaniiu poverkhnosti kryla) T V Koriaka *Aviatsionnaia Tekhnika*, vol 18, no 2, 1975, p 59-63. In Russian

A method is proposed for obtaining the mathematical model of a wing surface. The problem of calculating the wing profile is reduced to the determination of the coordinates of intermediate points that are required to determine the external configuration of the wing. The line of the wing profile is determined with the aid of a cubic parabola given in vector-parametric form. Analytical relations describing the upper and the lower surface of the wing are derived. V P

A75-40912 # Solution of the inverse problem of the hypersonic gas flow past a slender blunted body (K resheniiu obratnoi zadachi obtekanii tonkogo zatuplennogo tela giperzvukovym potokom gaza) N M Monakhov *Aviatsionnaia Tekhnika*, vol 18, no 2, 1975, p 69-77. In Russian

The flow of an ideal gas past a wing with a blunt leading edge and past a blunted body of revolution is analyzed in the case where the shock waves are similar to those generated by a strong detonation (self similar motion at a blunted plate or a blunted cylinder). An exact similar solution is obtained, using the classical perturbation method in combination with the Poincare-Lighthill-Kuo method. The equations derived describe the surface of the body situated in the flow and the density and pressure at this surface. It is shown that the third approximation is sufficiently accurate even at small distances from the bluntness. V P

A75-40913 # Vortex method for calculating a wing profile of arbitrary shape (Vikhrevoi metod rascheta profilii liuboi formy) Z Kh Nugmanov *Aviatsionnaia Tekhnika*, vol 18, no 2, 1975, p 78-83 9 refs. In Russian

The potential flow of an ideal incompressible fluid at an angle of attack past an arbitrary wing profile with a sharp leading edge is

analyzed. The reduced velocity at the wing surface is determined, in series form, from the solution of a Fredholm integral equation of the second kind. The series coefficients are obtained with the aid of the Bubnov-Galerkin method. V P

A75-40917 # 'Snap-through' vibrations of the empennage (O kolebaniakh 'proshchekivaniia' operenii) V A Pavlov *Aviatsionnaia Tekhnika*, vol 18, no 2, 1975, p 99-105 6 refs. In Russian

The vibrations of an empennage whose rudder moves on more than two hinges are analyzed. The equations of motion are derived and are reduced to a system of two nonlinear differential equations. It is shown that, in addition to resonance vibrations, rudder buffeting, and flutter, there may arise vibrations leading to snap-through of the rudder. The conditions leading to snap-through are identified. V P

A75-40918 # Approximate method for calculating the aerodynamic characteristics of semicircular wings with a constant sweep span (Priblizhennyi metod rascheta aerodinamicheskikh kharakteristik polukol'tsevykh kryl'ev s postoianno po razmakhu strelovidnost'iu) A I Pastukhov and G S Kudriavtsev *Aviatsionnaia Tekhnika*, vol 18, no 2, 1975, p 106-111. A75-40960 Integrally stiffened graphite/epoxy construction G C Krumweide (General Dynamics Corp., Convair Div., San Diego, Calif.) In Technology in transition, Proceedings of the Twentieth National Symposium and Exhibition, San Diego, Calif., April 29-May 1, 1975. Azusa, Calif., Society for the Advancement of Material and Process Engineering, 1975, p 57-66

An advanced wingbox test specimen incorporating graphite/epoxy skins and an aluminum substructure was designed, fabricated, and tested. Presented is a comprehensive discussion of the thermal-pressure-forming process used to produce the large, flat, integrally stiffened (cured I-section stiffeners) skin panels for this wingbox. In addition, the fabrication process for net-formed access doors, which are flush mounted to these skin panels, is described. The low-cost implications of these fabrication processes, with respect to minimizing manufacturing cost, are also presented. (Author)

A75-40963 Characterization of 8-mil boron/aluminum material J L Christian (General Dynamics Corp., Convair Div., San Diego, Calif.) In Technology in transition, Proceedings of the Twentieth National Symposium and Exhibition, San Diego, Calif., April 29-May 1, 1975. Azusa, Calif., Society for the Advancement of Material and Process Engineering, 1975, p 129-134. Research sponsored by the General Dynamics Corp.

The objective of this program was to determine the effect of boron filament diameter (8 mils versus 5.6 mils) on the mechanical

properties of boron/aluminum composite material. Longitudinal and transverse tensile, shear, and longitudinal and transverse fatigue properties were evaluated on three sheets of 8-mil diameter boron/aluminum material. Test results were compared with average properties of 5.6-mil boron/aluminum. Because of the attractive properties and potential cost reduction associated with 8-mil boron/aluminum, it is recommended that further evaluations be pursued to qualify this material for production use. (Author)

A75-40967 Static fatigue behavior of cellulose and polyamide materials. J. D. Boone (U.S. Navy, Naval Aerospace Recovery Facility, El Centro, Calif.) In *Technology in transition, Proceedings of the Twentieth National Symposium and Exhibition*, San Diego, Calif., April 29-May 1, 1975. Azusa, Calif., Society for the Advancement of Material and Process Engineering, 1975, p. 193-202.

About twenty different Federal or Military Specification materials of nylon (aliphatic polyamide), Kevlar (aromatic polyamide), linen, rayon, and cotton were tested. In the tests constant loads were applied and time to failure and elongation were measured. The results obtained in the tests are discussed, taking into account single constant loading, static loading at multiple levels of loading, and elongation under constant load. G. R.

A75-40972 Kerimid 353 bis-maleimide laminating resin. R. T. Alvarez and F. P. Darmory (Rhodia, Inc., New York, N.Y.) In *Technology in transition, Proceedings of the Twentieth National Symposium and Exhibition*, San Diego, Calif., April 29-May 1, 1975. Azusa, Calif., Society for the Advancement of Material and Process Engineering, 1975, p. 253-269.

Kerimid 353 is a three-component mixture of bis-maleimides. This addition polyimide can be used in a solvent-free wet-winding process at 125 C (255 F) to fabricate filament wound structures, laminates, and pultruded shapes. Graphite, glass, and Kevlar fibers have successfully been fabricated into laminates with Kerimid 353. Filament wound composites do not suffer from a wall thickness limitation. (Author)

A75-40973 Low-flow, low pressure curing resins. R. W. Vaughan, R. J. Jones, C. H. Sheppard, and G. A. Zakrzewski (TRW Systems Group, Redondo Beach, Calif.) In *Technology in transition, Proceedings of the Twentieth National Symposium and Exhibition*, San Diego, Calif., April 29-May 1, 1975. Azusa, Calif., Society for the Advancement of Material and Process Engineering, 1975, p. 287-295. Contract No. F33615-73-C-5094.

HYSTL modified epoxy (HME) resins were developed which provided Hercules A-S graphite fiber reinforced composites that were vacuum bag molded, had low resin flow during molding, possessed good fiber orientation and provided mechanical properties equivalent to those obtained with state-of-the-art epoxy resins. The composite panels vacuum bag molded during this program were equivalent to autoclave molded composites using state-of-the-art epoxy resins. Results from hydrolytic degradation studies demonstrated significant improvements with the HME resin over the commercially available systems. Application of the HME resin for use in graphite fiber reinforced composite skins on cocured honeycomb sandwich panels is being demonstrated. (Author)

A75-40985 Weldbonding of aluminum aircraft structures. E. B. Mikus and A. H. Freedman (Northrop Corp., Hawthorne, Calif.) In *Technology in transition, Proceedings of the Twentieth National Symposium and Exhibition*, San Diego, Calif., April 29-May 1, 1975. Azusa, Calif., Society for the Advancement of Material and Process Engineering, 1975, p. 424-438. Contract No. F33615-74-C-5027.

Weldbonding offers excellent potential for economical and efficient joining of aluminum structures. However, there are a number of problems which have prevented the production application of this process. In this paper, solutions to these problems are

discussed, areas where weldbonding may be applied to fighter-type aircraft are presented, and advantages of weldbonded structure over other metallic and advanced-composite structure are assessed for specific applications. (Author)

A75-40992 Preproduction evaluation of an improved titanium surface prebonding process. R. F. Wegman and M. J. Bodnar (U.S. Army, Materials Engineering Div., Picatinny Arsenal, Dover, N.J.) In *Technology in transition, Proceedings of the Twentieth National Symposium and Exhibition*, San Diego, Calif., April 29-May 1, 1975. Azusa, Calif., Society for the Advancement of Material and Process Engineering, 1975, p. 533-545. 6 refs.

A new titanium process developed to improve the durability of adhesive bonds to titanium has been evaluated for acceptability as a production process. Details are discussed as to the effects of sealing-up of the solutions from laboratory to production on bond durability, metal removal and quality control. The results given have been received from potential commercial users of the process. (Author)

A75-40999 * PMR polyimides - Processable high temperature composite matrix resins. W. E. Winters (TRW Equipment Group, Cleveland, Ohio) and T. T. Serafini (NASA, Lewis Research Center, Cleveland, Ohio) In *Technology in transition, Proceedings of the Twentieth National Symposium and Exhibition*, San Diego, Calif., April 29-May 1, 1975. Azusa, Calif., Society for the Advancement of Material and Process Engineering, 1975, p. 629-643. 6 refs.

Processing reproducibility and versatility were demonstrated for producing addition-cured polyimide/graphite fiber composites using a unique in situ polymerization of monomeric reactants directly on the fiber surface. The polymers so derived, designated PMR polyimides, can be fabricated into composite structures by laminating, random fiber molding or autoclave curing. Composites were determined to be thermally stable and retain useful properties after extended exposures at 550 to 650 F. The material and fabrication capability were demonstrated by the fabrication and evaluation of prototype complex fan blades. (Author)

A75-41000 Some production experiences with composite structures. J. D. Forest (General Dynamics Corp., Convair Div., San Diego, Calif.) In *Technology in transition, Proceedings of the Twentieth National Symposium and Exhibition*, San Diego, Calif., April 29-May 1, 1975. Azusa, Calif., Society for the Advancement of Material and Process Engineering, 1975, p. 644-648.

Two of the composite structures considered are graphite/epoxy articles for Atlas missile service. One article, the Atlas bulkhead, is a flat pressure diaphragm. The other is a conical interstage adapter. A third application discussed involves boron/aluminum tubes which are used on the Orbiter midfuselage. The performance of the composite structures is evaluated. It is found that the articles show measurable performance improvements over their metal counterparts. G. R.

A75-41100 # Device for determining the location of the maximum climb rate of an ascending air current (*Ustroistvo dlia opredeleniia mestoraspologheniia maksimuma skoropod'emnosti voskhodiashchego potoka vozdukh*). A. T. Lavrova and V. N. Chubikov (Moskovskii Aviatsonnyi Institut, Moscow, USSR) *Pribo-rostroenie*, vol. 18, no. 5, 1975, p. 92-96. In Russian.

The problem of finding the location of the maximum climb rate of an ascending air current for glider flight applications is posed, and an approach to its solution is set which is based on comparison of the angles of attack of the two half-wings relative to each other. Measuring the difference between the two angles of attack yields information on the location of the center of the upward current relative to the longitudinal axis of the glider. This measurement would be accomplished by two vent openings placed on the upper and lower surfaces of each airfoil and in communication with each other via a chamber with manometric equipment. P. T. H.

A75-41179 # Overview - Turbofan STOL transport aircraft technology Edited by T D Pilsch (US Air Force Academy, Colorado Springs, Colo.) *American Institute of Aeronautics and Astronautics, Annual Meeting and Technical Display, 11th, Washington, D C, Feb 24-26, 1975, Paper 75-300* 13 p 31 refs

The V/STOL Aircraft Systems Technical Committee of the AIAA has prepared a survey report on the present state of technology in the development of turbofan STOL transport aircraft. The survey begins with a discussion of how the unique requirements for such an aircraft influence the choice of technology to be employed. The leading unpowered and powered high lift concepts are identified and compared as to performance, operational suitability, and environmental impact. The development of associated technology required to support a STOL transport system is also covered. (Author)

A75-41233 # The jet flap wing in proximity to the ground, giving particular attention to large angles of attack and large jet-flap angles (Der Strakklappenflügel in Bodennahe unter besonderer Berücksichtigung grosser Anstell- und Strahlklappenwinkel) R Lohr-Bochum, Ruhr-Universität, Dr.-Ing. Dissertation, 1973 183 p 74 refs. In German

A procedure is developed for the calculation of the effect of ground proximity on the aerodynamic coefficients of a jet flap wing of infinite span. A computational method for a slender wing profile with a weak camber for small angles of attack is considered. The method is based on the two-dimensional theory presented by Spence (1961). The method is subsequently extended to wings with large angles of attack. The relationship between the aerodynamic coefficients and the angle of attack is found to be nonlinear. The computed values show satisfactory agreement with experimental data. G R

A75-41404 # COMED - A combined display including a full electronic facility and a topographical moving map display W M Aspin (Ferranti, Ltd., Edinburgh, Scotland). In *Advanced Aircrew Display Symposium, 2nd, Patuxent River, Md, April 23, 24, 1975, Proceedings* Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1975, p 160-171

The COMED display provides color topographical map display annotated with suitable navigation parameters, a high resolution radar display with or without radar/map matching, a high definition TV picture, tabular displays of weapon status, backup engine instrumentation, and backup primary flight instrumentation. Aspects of optical design are discussed along with questions of system construction. G R

A75-41405 # Holographic horizontal display system G T Burton (RCA, Government Communications and Automated Systems Div., Burlington, Mass.). In *Advanced Aircrew Display Symposium, 2nd, Patuxent River, Md, April 23, 24, 1975, Proceedings* Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1975, p 172-191. Navy-sponsored research.

The display system considered employs a holographic subsystem for the storage and display of multicolor aerial chart information and a rear projected CRT subsystem for the presentation of dynamic annotation and sensor information. A description of the holographic concept is given. The multicolor recording system is considered along with aspects of registration and address data recording, the cockpit display system, the transport interface, demonstration hardware, annotation data display, and questions of packaging. G R

A75-41408 # Vertical Display/Master Monitor Display W C Hoffman and J L Heard (Hughes Aircraft Co., Culver City, Calif.). In *Advanced Aircrew Display Symposium, 2nd, Patuxent River, Md, April 23, 24, 1975, Proceedings* Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1975, p 250-269

The development of two display systems intended for use in the advanced Navy all weather attack aircraft of the 1980s is discussed. The Vertical Display System is one of the primary flight and sensor data display systems and presents both flight control data and sensor data for navigation and weapon delivery. The Master Monitor Display is a data processing and display system conceived to provide an aircrew with an integrated presentation of information of various types. G R

A75-41410 # Pilot information requirements for air combat maneuvering G W Hoover and J F Watler, Jr (Northrop Corp., Aircraft Div., Hawthorne, Calif.). In *Advanced Aircrew Display Symposium, 2nd, Patuxent River, Md, April 23, 24, 1975, Proceedings* Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1975, p 295-313

The definition of the air combat maneuvering operational environment in phases is considered along with the establishment of the operational objectives of each phase. Information requirements for the pilot are in part related to the establishment of the presence of other aircraft, the location of the other aircraft, the determination of the other aircraft's direction and velocity, and an evaluation of this information, taking into account factors related to the condition of the pilot himself and his aircraft. Approaches to assist the pilot in his problem to make the right decision for the given conditions are briefly examined. G R

A75-41411 # Combat Energy Maneuverability Display - CEMD /Flight dynamic and fire control information integration/ E L Cloud, J N Fendley, and T A Stinnett (Westinghouse Defense and Electronic Systems Center, Baltimore, Md.). In *Advanced Aircrew Display Symposium, 2nd, Patuxent River, Md, April 23, 24, 1975, Proceedings* Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1975, p 314-332. Research supported by the Westinghouse Independent Research and Development Program.

Air combat tactical requirements are examined and combat energy management display requirements are investigated, taking into account the comparative specific energy curves for two aircraft as a function of altitude vs airspeed. Display requirements include the presentation of projected time in relation to a maximum maneuver envelope, an instantaneous velocity vector, and a projected velocity vector. A suitable approach for providing the needed information is discussed, giving attention to the CEMD. G R

A75-41415 # The use of in-flight simulation to develop control system and display requirements for conventional and V/STOL airplanes E W Aiken, G W Hall, and J V Levacqz (Calspan Corp., Buffalo, N Y). In *Advanced Aircrew Display Symposium, 2nd, Patuxent River, Md, April 23, 24, 1975, Proceedings* Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1975, p 377-392. 5 refs.

The present work discusses recent research programs that clearly demonstrate the utility of in-flight simulation or variable stability airplanes in the development of flight control system and display requirements for conventional and V/STOL aircraft. Interactive dynamic coupling among the elements of the pilot-airplane flight control-display system is specifically treated. A research approach should include the following steps in order to establish useful system design criteria: theoretical analyses using mathematical models of the human pilot in conjunction with generic aircraft/control system combinations to develop appropriate display design philosophies, a research vehicle that provides wide variations in both control characteristics and display presentations for the implementation of the hypothesized designs, and flight experiments using realistic tasks in realistic environments to test the validity of the designs. A75-41474 # On the response of an airplane to sinusoidal gust M Kobayakawa, Y Takashi, and H Maeda (Kyoto University, Kyoto, Japan). *Japan Society for Aeronautical and Space Sciences, Transactions*, vol 18, June 1975, p 64-75. 8 refs.

The effects of aerodynamic interference between wing and tail panels on the longitudinal response of an airplane to a sinusoidally varying wind gust are investigated. The response functions of an airplane to a sinusoidal gust are calculated theoretically on the basis of Reissner's method, while the response functions and phase differences between the gust and the lift force are determined experimentally using an airplane model in a low-speed wind tunnel. The results show that the response functions increase with increasing tail height and decrease with increasing distance between wing and tail

A75-41598 # A contribution to the design of digital self-adaptive flight control systems (Ein Beitrag zum Entwurf digitaler, selbstadaptiver Flugregelsysteme) U Hartmann Hannover, Technische Universität, Fakultät für Maschinenwesen, Dr.-Ing. Dissertation, 1974 158 p 50 refs In German Research supported by the Bundesministerium der Verteidigung

An approach for the design of a digital adaptive flight controller is discussed, giving particular attention to questions of implementation. A description of the controlled parameters is given, a design procedure for the completely measurable state vector is derived, and two design examples are presented. Processes for the case in which the state parameters are not measurable are also considered. Methods for the identification of state models on the basis of input and output measurements are considered along with the function of the self-adaptive flight control system

A75-41630 * # FCAP - A new tool for the evaluation of active control technology R B Noll (Aerospace Systems, Inc., Burlington, Mass.) and L Morino (Boston University, Boston, Mass.) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug 20-22, 1975, Paper 75-1059* 10 p 15 refs Contract No NAS1-13371

A computer program has been developed for the evaluation of flight control systems designed for flexible aircraft. This Flight Control Analysis Program (FCAP) is designed in a modular fashion to incorporate sensor, actuator, and control logic element dynamics as well as aircraft dynamics and aerodynamics for complex configurations. Formulation of the total aircraft dynamic system is accomplished in matrix form by casting the equations in state vector format. The system stability and performance are determined in either the frequency or time domain using classical analysis techniques. The aerodynamic method used also permits evaluation of the flutter characteristics of the aircraft
(Author)

A75-41631 # Use of fly-by-wire to obtain performance improvements in a delta-canard design B J Kuchta (General Dynamics Corp., Convair Aerospace Div., San Diego, Calif.) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug 20-22, 1975, Paper 75-1061* 11 p

This paper describes the performance benefits that can be gained through application of fly-by-wire (FBW) and relaxed static longitudinal stability to a high-performance, delta-wing fighter aircraft. Relaxed static stability (RSS) is obtained by incorporating a controllable, close-coupled canard that is positioned to generate favorable aerodynamic interference with the wing. The RSS concept, combined with FBW, provides increased maneuverability, reduced trim drag, lower wing load, well-distributed fuselage loads. The net result is a weight reduction of about one thousand pounds when the RSS/FBW delta-canard configuration is compared to a conventional wing-tail configuration designed for the same mission. Control laws for optimum canard-elevon gearing are discussed, as are techniques for determining control power requirements
(Author)

A75-41640 # Development of automatic terrain-following/automatic terrain-avoidance decoupling techniques. L U Nardi and H Y Kawana (Rockwell International Corp., Los Angeles, Calif.) *American Institute of Aeronautics and Astronautics, Guidance and*

Control Conference, Boston, Mass., Aug 20-22, 1975, Paper 75-1074 11 p Contract No F33615-73-C-3062

This paper describes the synthesis and evaluation of several control laws for independent decoupled control of the horizontal and vertical flight path vectors during automatic terrain-following/automatic terrain-avoidance (ATF/ATA) operations. Simultaneous control of both vertical (ATF) and lateral (ATA) maneuvers induces an undesired coupling between axes and greatly reduces low-altitude penetration performance. The nature of the coupling problems and the control system design techniques utilized in the ATF/ATA coupler control law development are presented in detail. The coupling performance is demonstrated in a simulation study to show the benefits achievable when applied to a high-performance strategic bomber
(Author)

A75-41641 # Integrated flight/propulsion control by state regulation W R Seitz (Bendix Research Laboratories, Southfield, Mich.) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug 20-22, 1975, Paper 75-1075* 8 p 8 refs

The application of modern control theory to integrated flight/propulsion control system design is receiving increased attention. Future control configured aircraft with variable geometry engines will have operating modes that involve radically interacting airframe and thrust effects. Linear state regulator theory, with its ability to accommodate large order, multivariable systems, appears to be well suited to the control synthesis task. Automated design procedures allow the control designer great flexibility and facilitate the investigation of more alternatives in the evolution of a design. Results from an exercise with conventional airframe and engine models illustrate the design procedure
(Author)

A75-41642 # Aircraft optimal weapon delivery maneuvers based on extended energy management A J Calise, R Aggarwal (Dynamics Research Corp., Systems Div., Wilmington, Mass.), and G M Anderson (USAF, Institute of Technology, Wright-Patterson AFB, Ohio) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug 20-22, 1975, Paper 75-1076* 11 p 10 refs Contract No F08635-73-C-0076

Optimal, three-dimensional weapon delivery maneuvers for launching an air-to-air missile are derived using an Extended Energy Management approach. The attacking aircraft is controlled to achieve an optimal relative position to the target prior to missile launch for the stated initial conditions and terminal constraints at launch. An algorithm for defining the attacker's optimal control as a function of current target state and turn rate was developed and used in a point mass 3DOF simulation. Attacker trajectories are shown for varying launch conditions. Each trajectory results from a single integration of the equations of motion forward in time. Numerical comparisons are made to optimal solutions computed using an iterative gradient algorithm. Both high speed and low speed yo-yo type maneuvers are exhibited
(Author)

A75-41643 * # Wind modeling and lateral control for automatic landing W E Holley (Oregon State University, Corvallis, Ore.) and A E Bryson, Jr (Stanford University, Stanford, Calif.) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug 20-22, 1975, Paper 75-1077* 11 p 27 refs Grant No NGL-05-020-007

For the purposes of aircraft control system design and analysis, the wind can be characterized by a mean component which varies with height and by turbulent components which are described by the von Karman correlation model. The aircraft aerodynamic forces and moments depend linearly on uniform and gradient gust components obtained by averaging over the aircraft's length and span. The correlations of the averaged components are then approximated by the outputs of linear shaping filters forced by white noise. The resulting model of the crosswind shear and turbulence effects is used in the design of a lateral control system for the automatic landing of a DC-8 aircraft
(Author)

A75-41644 * # Time-controlled descent guidance in uncertain winds G Menga and H Erzberger (NASA, Ames Research Center, Moffett Field, Calif) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass, Aug 20-22, 1975, Paper 75-1078* 10 p 13 refs

A procedure has been developed for constructing a statistical model of the altitude-dependent mean wind profile from the historical record of wind measurements at particular locations. The model is constructed by fitting a Markov process, with altitude as the stage variable, to the historical wind data. The wind model, together with the aircraft dynamics and the error characteristics of the navigation system, are incorporated in the design of a state estimator, which gives the minimum variance estimate of the aircraft state and the wind vector. The state and wind estimates are used as inputs to a linear feedback law for guiding the aircraft along the nominal trajectory. An example design of a time constrained (4D RNAV) descent guidance system is presented, showing tracking accuracy, control activity, and probability of arrival time with and without the wind estimator (Author)

A75-41648 # Design of an improved azimuth reference system B M Mertz (USAF, Test Group, Holloman AFB, N Mex) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass, Aug 20-22, 1975, Paper 75-1083* 5 p

An improved azimuth reference facility has been developed to provide increased accuracy required for the alignment and testing of 'state-of-the-art gyrocompassing devices. The facility permits evaluation of the various error sources involved with the determination of azimuth by astronomical, geodetic and inertial means. The system incorporates current techniques for measuring, transferring and storing azimuth in an attempt to determine optimum procedures. The system also includes a highly instrumented, automated azimuth reference monument containing optical and inertial azimuth storage devices, seismometers, tiltmeters and additional environmental sensors. An exterior weather station is also included in that system. The continuous and systematic evaluation of the outputs of those instruments results in an improved azimuth reference capability (Author)

A75-41649 # Effects of sampling rate and transformation techniques on the design of digital notch filters G E Lang and J G McGough (Bendix Corp, Teterboro, NJ) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass, Aug 20-22, 1975, Paper 75-1084* 10 p

Automatic flight control system design for high performance aircraft requires high bandwidth and, therefore, effective means of attenuating or controlling the structural bending modes. This, in turn, involves the use of rather complex notch filters. When utilizing digital computers, these compensators may require high sampling rates and considerable memory, thus constraining the digital computer cost, reliability and availability. The paper discusses several techniques for transforming continuous functions to discrete functions for the purpose of designing better digital filters (Author)

A75-41650 # Digital multimode flight control system T R Yechout (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio) and D R Oelschlaeger (Honeywell, Inc, Minneapolis, Minn) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass, Aug 20-22, 1975, Paper 75-1085* 9 p

A digital multimode flight control system has been developed and flight tested on an A-7D tactical aircraft by the Air Force Flight Dynamics Laboratory and Honeywell Inc. Dual-redundant, whole-word digital processors are used to compute the inner-loop stability and control augmentation functions and outer-loop pilot relief functions for the A-7D. The system features pilot selectable control modes (multimodes) designed to enhance tracking performance by tailoring aircraft handling qualities to specific weapon delivery tasks.

This program is the first Air Force digital flight control flight test effort and, as such, is intended to provide a baseline for future digital and multimode flight control applications including fly-by-wire (Author)

A75-41651 # Digital flight control for advanced fighter aircraft R Gran, H Berman, M Rossi, and D Rothschild (Grumman Aerospace Corp, Bethpage, NY) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass, Aug 20-22, 1975, Paper 75-1086* 10 p 9 refs

The operating characteristics of the next generation of fighter aircraft impose severe constraints which the control systems of these aircraft must overcome. The use of linear optimal digital control techniques allows one to answer some of the outstanding questions concerning how to design digital fly-by-wire control systems. By using an 'implicit model following' technique we have found that design specifications may be easily incorporated into the controller. By concentrating on noise and uncertainty we have found how to maximize the computer sample time, thereby reducing computer utilization. By appropriately incorporating all control surfaces we have found how to use these controls harmoniously to achieve the desired performance. Finally, all of these have been accomplished with a set of computer-aided design programs that are easily used and give rapid results. This paper describes the theoretical basis of our techniques and its application to a typical 1980's advanced fighter aircraft (Author)

A75-41652 # YC 14 digital flight control data management R E Kestek (Boeing Aerospace Co, Seattle, Wash) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass, Aug 20-22, 1975, Paper 75-1087* 6 p

The YC-14 Electrical Flight Control System digital computers are required to process analog, discrete and serial digital input data in performing the flight control tasks. The three channel system must process data so that identical data are available to each computer. A second requirement is to minimize the time delay between the input of data and the output of results computed from the data (Author)

A75-41653 # Balanced functional design of automatic digital flight control systems D B Mulcare and J W Benson (Lockheed-Georgia Co, Marietta, Ga) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass, Aug 20-22, 1975, Paper 75-1088* 10 p 5 refs

Emphasis is placed upon the practical consideration of the total loop with all its functional effects and characteristics in achieving a comprehensive and balanced control-system design. The analytical development phase, which is crucial to the design process, receives particular attention in the form of a recommended methodology. This includes extensive use of hybrid simulation and concurrent analog and digital mechanization development to reduce risk and schedule span. As an example, the digital implementation of a priori inner- and outer-loop control laws is undertaken, and the resultant configuration is analyzed and refined. Stability margins are the limiting factors in minimizing sampling rates, but the granularity of the control column and surface motions of the outer-loop mode place corresponding restrictions (Author)

A75-41654 # Propagation of gravity gradiometer errors in an airborne inertial navigation system M A Gerber (TRW Systems Group, Redondo Beach, Calif) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass, Aug 20-22, 1975, Paper 75-1089* 9 p 12 refs Contract No F04701-74-C-0327

The characteristics of gravity gradiometer error propagation in a horizontal channel of an inertial navigation system moving at aircraft speed near the earth are studied. The analysis considers white noise, time-correlated noise, random constant bias, and random constant drift gradiometer errors. A Kalman filter is used to process the gradiometer measurements and provide corrections to the inertial system for gravity-induced errors. The filter is formulated to estimate

the errors in gravity, the gradiometers, and the inertial navigation system. The error behavior is then determined by numerical propagation of the filter's covariance equation. Transient errors produced by bias and bias drift are found to be dominant for the first Schuler cycle while long-term performance is primarily governed by random noise in that part of the spectrum near the Schuler frequency (Author)

A75-41655 # Accuracy improvement in a gravity gradiometer-aided cruise inertial navigator subjected to deflections of the vertical. C. Grubin (Hughes Aircraft Co., El Segundo, Calif.) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug. 20-22, 1975, Paper 75-1090* 11 p. 7 refs.

This paper develops navigation error equations for a gravity gradiometer-aided single-axis Schuler cruise navigator and compares the errors numerically with those for an unaided navigator when both are driven by the same anomalous gravity. The model for anomalous gravity is a distribution of point masses whose strengths and locations are randomly chosen so that the statistics on the vertical deflection agree with measured data. Since the gradiometer has a bias error, its output is only imperfectly integrated, typically, the integration time constant is 1-5 hours. The paper examines the effect of instrument biases, scale factor and misalignment errors, gravity anomaly initialization errors, and Schuler resonance on navigation accuracy. Of these, the most important error is a bias since it can produce large position errors. Simple formulas for predicting peak velocity error and steady state position error due to a bias are given (Author)

A75-41663 # The use of autocorrelation functions to predict the effects of vertical deflections on aircraft navigation. U. Bernstein and R. I. Hess (Logicon, Inc., San Pedro, Calif.) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug. 20-22, 1975, Paper 75-1101* 6 p. 8 refs.

Autocorrelation functions (ACFs) of surface gravity anomalies are used as a method of predicting expected aircraft navigation errors induced by deflection model uncertainties. Theoretical methods are developed to propagate ACFs from the surface to aircraft altitudes, to determine ACFs of vertical deflection components from ACFs for gravity anomalies, and to predict average position and velocity uncertainties in the aircraft navigation system which arise from uncertainties in modeling vertical deflections. Numerical results include a study of navigation error sensitivities to system parameters and estimates of representative navigation errors implied by using several specific deflection models in the U.S. (Author)

A75-41671 # Inertially aided ranging for guidance systems. C. M. Brown, Jr., C. F. Price (Analytic Sciences Corp., Reading, Mass.), and W. H. Licata (U.S. Navy, Naval Surface Weapons Center, Silver Spring, Md.) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug. 20-22, 1975, Paper 75-1109* 8 p. Contract No. N60921-74-C-0235.

This paper demonstrates the feasibility of an inertially aided ranging technique for use in an airborne guidance system. The technique employs a data processing algorithm, based upon optimal estimation theory, which estimates range and range rate to a surface target in cases where these quantities cannot be measured directly. The algorithm design is evaluated by calculating its associated root-mean-square range and range-rate estimation errors, making use of a realistic analytical model of the system dynamics and sensor error sources. Sensitivity results are included to demonstrate the effects of target maneuver characteristics, measurement noise level, and trajectory peak altitude (Author)

A75-41673 # On the design of a model reference adaptive flight control system. P. N. Nikiforuk, M. M. Gupta (Saskatchewan, University, Saskatoon, Canada), K. Kanai, and H. Adachi (National Defense Academy, Yokosuka, Japan) *American Institute of Aero-*

nautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug. 20-22, 1975, Paper 75-1111 9 p. 11 refs. National Research Council of Canada Grants No. A-5625, No. A-1080, Defence Research Board of Canada Grants No. 4003-02, No. 9781-06.

Three different approaches for the design of a model reference adaptive controller for an aircraft flight control system are developed. The aircraft is assumed to be operating over a wide range of parameters in an uncertain environment. In these approaches the desired handling qualities of the aircraft system are represented in terms of a model, and the adaptive controller forces the aircraft system to track the model as closely as desired. The designs are based upon Liapunov stability methods. The first approach uses the parameter adaptation of the feedback and feedforward paths of the aircraft system. The second and third approaches use the signal synthesis adaptive method. The feasibility of these approaches was investigated by simulating a typical aircraft system (Author)

A75-41680 # Determination of aerodynamic coupling derivatives through flight test. T. R. Driscoll, R. C. Stockdale, and F. J. Schelke (Martin Marietta Aerospace, Orlando, Fla.) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug. 20-22, 1975, Paper 75-1119* 7 p.

The control of a highly responsive surface-to-air missile is dependent upon the aerodynamic characteristics of the selected airframe. Although the aerodynamic forces and moments are obviously important, the partial derivatives of these variables are the primary characteristics that determine the stability of the control system. Of particular interest are the aerodynamic coupling derivatives (those forces and moments induced in one autopilot channel by changes in another channel). These coupling characteristics can be accurately determined during the flight test program by (1) including test sequences that excite these coupling forces and produce a measurable response, and (2) developing a technique to equate these flight test responses to numerical values of the aerodynamic derivatives. This paper describes such a technique developed for a typical surface-to-air missile and presents results based on actual flight test sequences (Author)

A75-41682 # Optimal design of a Mini-RPV lateral autopilot. I. Y. Bar-Itzhack (Technion - Israel Institute of Technology, Haifa, Israel) and E. Ferdman *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug. 20-22, 1975, Paper 75-1121* 10 p. 10 refs.

In this paper the design of a lateral autopilot for a miniature remotely piloted vehicle (RPV) is described. The structure of the autopilot is predetermined, as well as the measured variables. Even though aileron alone is used to control the RPV, the system is completely controllable. Using several indices of performance the best autopilot gains are determined by minimizing these indices. The minimization is carried out in the complex plane and comparison is made with state space methods. When a single error, such as heading error, is considered, the complex plane minimization procedure is superior. The RPV poles due to the Dutch roll mode stay close to the imaginary axis, although heavy penalty is imposed by the performance index on a persisting error. The pole placement is restricted by the fact that the trace of the system matrix is constant. Although no rudder is used, the vehicle executes coordinated turns due to its natural coordination quality (Author)

A75-41683 # Automatic control of drones and RPV's in formation. W. H. Lee, Jr. and L. T. Richardson (IBM Corp., Federal Systems Div., Huntsville, Ala.) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug. 20-22, 1975, Paper 75-1122* 8 p. Grant No. DAAH01-74-C-0523, Contract No. F30602-74-C-0097.

A system for automatic formation control of target vehicles has been developed and successfully demonstrated by flight testing. The system, which was designed for navigation, guidance, and control of up to six vehicles simultaneously, employs distance measuring

equipment (DME) for tracking/navigation Simulation was employed extensively to minimize risks and reduce flight testing time The system and the tools used in its development and evaluation are described Also presented are results of flight tests of two MQM-34D target vehicles guided along precise flight paths in closely spaced formation (Author)

A75-41684 * # Optimum flight profiles for short haul missions H Erzberger, J F Barman, and J D McLean (NASA, Ames Research Center, Moffett Field, Calif) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug 20-22, 1975, Paper 75-1124* 12 p 8 refs

An algorithm, based on the energy-state method, is derived for calculating optimum trajectories with a range constraint The basis of the algorithm is the assumption that optimum trajectories consist of, at most, three segments an increasing energy segment (climb), a constant energy segment (cruise), and a decreasing energy segment (descent) The algorithm is used to compute minimum fuel, minimum time, and minimum direct-operating-cost trajectories, with range as a parameter, for an in-service CTOL aircraft and for an advanced STOL aircraft Use of a simplified trajectory increases the fuel consumption of the total descent trajectory by about 10 percent and the time to fly the descent by about 19 percent compared to the optimum (Author)

A75-41685 # Conflict resolution maneuvers in an Intermittent Positive Control system P A Palicio and J F Golden (Mitre Corp, McLean, Va) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug 20-22, 1975, Paper 75-1125* 10 p US Department of Transportation Contract No FA70WA-2448

This paper compares the effectiveness of horizontal and vertical collision avoidance maneuvers in an Intermittent Positive Control (IPC) system by studying the results of a Monte Carlo simulation of encounters between two aircraft Several combinations of low performance and high performance aircraft, with both in straight flight or with one turning into the other, are simulated and the results are analyzed The analysis has been used to improve IPC design by providing for both the selection of a more effective detection algorithm and the refinement of the resolution rules to include a decision on the more appropriate type of primary maneuver (horizontal or vertical) to solve different kinds of encounters It is recommended that horizontal maneuvers be used for solving encounters between low performance aircraft For solving encounters between high performance aircraft, and between a high performance and a low performance aircraft, vertical maneuvers are the best choice (Author)

A75-41686 * # Flight experience with time-of-arrival control for STOL aircraft in the terminal area F Neuman and H Q Lee (NASA, Ames Research Center, Moffett Field, Calif) *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Boston, Mass., Aug 20-22, 1975, Paper 75-1126* 9 p 6 refs

A research program on STOL operating systems is underway at the Ames Research Center One investigation is concerned with design, analysis, and flight test of promising four-dimensional RNAV systems One promising system generates a capture flight path from the present aircraft position to a waypoint on a selected fixed STOL approach route It predicts arrival time at the runway and controls time and position along the path The system was flight tested using a digital avionics system on a Convair 340 and on an experimental powered-lift STOL airplane Flight tests in the flight director mode show that the pilot can choose and change the desired time of arrival, and meet this time within a few seconds, in spite of navigation errors and varying winds Initial tests of the automatic mode using a flight simulator and the NASA Augmentor Wing Jet STOL Research Aircraft (AWJSRA) show that good time control was achieved at the cost of excess throttle activity This fault was later corrected (Author)

A75-41689 * # Techniques for determining propulsion system forces for accurate high speed vehicle drag measurements in flight H H Arnaiz (NASA, Flight Research Center, Edwards, Calif) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-964* 14 p 6 refs

As part of a NASA program to evaluate current methods of predicting the performance of large, supersonic airplanes, the drag of the XB-70 airplane was measured accurately in flight at Mach numbers from 0.75 to 2.5 This paper describes the techniques used to determine engine net thrust and the drag forces charged to the propulsion system that were required for the in-flight drag measurements The accuracy of the measurements and the application of the measurement techniques to aircraft with different propulsion systems are discussed Examples of results obtained for the XB-70 airplane are presented (Author)

A75-41690 # PABST - A technology demonstrator E W Thrall, Jr (Douglas Aircraft Co, Long Beach, Calif) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-989* 10 p

The objective of the Primary Adhesively Bonded Structure (PABST) program is to improve the structural integrity and durability of future Air Force aircraft while providing significant cost-of-ownership savings This paper presents the structural design arrangement selection process which examines static strength, fatigue, and damage tolerance criteria The surface treatment optimization program, which examines phosphoric acid and chromic acid anodize (using optimized FPL etch as a standard) is reviewed with current test results The maximized corrosion resistance afforded by these surface treatments is the key to increased durability The adhesive selection process is presented with test data The proposed structural development test plans are discussed The paper concludes with the projected design, manufacture, and test plans for the full scale advanced development program (ADP) component This 52-foot section is the entire cargo compartment of the YC-15 aircraft (Author)

A75-41691 # Thermostructural and material considerations in the design of the F-14 aircraft transparencies S Z Fixler (Grumman Aerospace Corp, Bethpage, N Y) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif, Aug 4-7, 1975, Paper 75-990* 12 p 8 refs

Thermostructural and material aspects in the design of the F-14 aircraft transparencies are presented An attempt is made to trace the evolution of the final design configuration, and its in-service-dictated modifications, under the constraints of cost, weight and schedule without sacrificing vital performance Design requirements are given and the transparencies along with the systems that affect the load and thermal environments are fully described Results of tradeoff studies between monolithic and multilaminate configurations are shown Windshield and canopy temperature and thermal stress distributions are presented for acrylics and polycarbonates Transparency material ranking criteria are given Results of an analytical and experimental investigation on the effects of extreme thermal environments on canopy distortions are presented Predicted and in flight measured canopy temperature correlations are shown It is shown how various factors influenced the crucial decision processes that were vital in arriving at a successful design configuration (Author)

A75-41692 # Advanced high lift design through analytical/experimental techniques J A Braden, L Barnett, A E Holmes, and M E Carlton (Lockheed-Georgia Co, Marietta, Ga) *American Institute of Aeronautics and Astronautics, Aircraft Systems and*

Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-992 20 p 37 refs

Several analytical techniques are discussed which deal with two-dimensional multi-element airfoil viscous flow analysis, three-dimensional utilization of section data so derived, calculation methods for powered lift systems, and the need to recognize non-planar wake effects in three-dimensional high lift calculations when lift performance exceeds certain limits. Capabilities of the methods are also illustrated. This is followed by a description of a new, broad purpose, high lift technology (HLT) wind tunnel model and of the utilization of the analytical methods to design its double slotted mechanical flap system. Leading edge blowing with mechanical flaps and Coanda flaps is also discussed. Experimental performance of the HLT model is also shown, including comparisons with analytical estimates. These comparisons include mechanical flaps with and without leading edge blowing. It is especially significant that the leading edge slat gap and deflection design optimization for lift, which was conducted in the attached flow region, was experimentally shown to also be a valid optimization for maximum lift. (Author)

A75-41693 # DC-9 flight testing of the refanned JT8D engine E M Lowder and R C Hanwell (Douglas Aircraft Co., Long Beach, Calif.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-998 9 p 7 refs*

Two refanned JT8D engines, each equipped with a larger single-stage fan and an acoustically treated nacelle, were installed and tested on a DC-9 30 airplane. The primary noise tests consisted of takeoff and approach-related flyover runs that were consistent with FAR test procedures. Survey-type flyovers were also conducted to obtain data to complete a basic map of flyover noise as a function of engine power and airplane height. Other noise measurements were obtained to evaluate the relative strengths of the various engine-noise components. Considerable testing was done to assess the effect of the refanned engine and its installation on flightworthiness and basic airplane/engine performance. The results indicate that significant noise reduction was achieved and that flight characteristics and structural integrity were acceptable. (Author)

A75-41694 # The results of fabrication and testing of the prototype composite rotor blades for HLH and UTTAS T S Scarpatti, R J Feenan, and W K Stratton (Boeing Vertol Co., Philadelphia, Pa.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-1010 16 p*

This paper tells how the detailed configurations of the composite rotor blades for Boeing Vertol's HLH and UTTAS helicopters were developed. It presents the major reasons and design considerations for each material selection. Results of fabrication and testing of the initial prototype blades are also presented and compared to initial predictions for strength and fabrication manhours. The design and fabrication problems are highlighted, along with their solutions. A production, design to-cost configuration, developed from integration of the results of the three-year development program, is presented. (Author)

A75-41695 * # Design of a V/STOL technology airplane J M Zabinsky (Boeing Commercial Airplane Co., Seattle, Wash.) and R W Burnham (Boeing Aerospace Co., Seattle, Wash.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-1012 7 p 11 refs Contract No NAS2-6563*

A two-engine three-fan V/STOL airplane was designed to demonstrate and develop the technology for operational V/STOL and STO-VL aircraft having safe engine-out characteristics. Engine-out requirements, integration of propulsion and aerodynamic controls, and propulsion installation are the major factors affecting the

configuration. Use of variable pitch fans enhances the control system providing a responsive and versatile airplane. The ability to operate over the entire flight spectrum from zero speed to $M = 0.8$ is required to demonstrate operational capability with a V/STOL system.

A75-41696 # Aerodynamic design of the Boeing YC-14 advanced medium STOL transport /AMST/ F W May and G E Bean (Boeing Commercial Airplane Co., Seattle, Wash.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-1015 11 p 6 refs*

Development of the USAF/Boeing YC-14 prototype configuration has challenged the designer to couple the latest in aerodynamic technology with a unique configuration concept which provides remarkable STOL performance while maintaining efficient cruise capability and safe handling characteristics. STOL performance is achieved through the application of a new powered lift technique known as Upper Surface Blowing, in which the exhaust of the twin high bypass ratio turbofan engines is directed over the upper surface of the wing and flap and deflected by the Coanda effect. Successful integration of the propulsion/powered lift system into a cruise configuration using advanced technology airfoils and extensive tailoring of the wing, nacelle and large cross-section fuselage has produced an airplane capable of safe and efficient operation over a wide spectrum of airlift missions. A75-41698 * # Fuel conservation possibilities for terminal area compatible transport aircraft G W Hanks (Boeing Commercial Airplane Co., Seattle, Wash.) and A R Heath, Jr (NASA, Langley Research Center, Hampton, Va.) *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Meeting, Los Angeles, Calif., Aug 4-7, 1975, Paper 75-1036 14 p 7 refs Contract No NAS1-12018*

Design characteristics that would reduce mission fuel consumption and improve terminal area operations for advanced transports are discussed. Sensitivity studies of the effects of cruise speed, wing geometry, propulsion cycle, operational procedures, and payload on fuel usage are presented and utilized to arrive at a conceptual configuration which offers mission fuel savings as well as desirable operational characteristics in the terminal area. Technical and economic evaluation is provided in the form of a comparison of the resulting configuration with transports reflecting the current level of technology. The research and technology programs required to realize potential benefits are described. (Author)

The Marine Air Traffic Control and Landing System (MATCALS) is being developed by the Naval Electronic Systems Command to upgrade Air Traffic Control and All-Weather Landing Control capabilities at Marine Corps expeditionary airfields. This paper addresses the All-Weather Landing Segment (ALS) of MATCALS, particularly the automatic landing capability. The AN/TPN-22 Precision Approach and Landing Radar and those major landing control features that provide interoperability with other landing systems are emphasized. A discussion is presented of the semiautomatic landing service that is available to all aircraft from ALS without the need for additional aircraft avionics. (Author)

A75-41702 Air safety as seen from the tower J K King *IEEE Spectrum*, vol 12, Aug 1975, p 67-71

The proposal is made to implement a computerized airborne collision avoidance system which is pilot-monitored, aircraft contained, and independent of ground control. It is pointed out that the continued reliance upon a ground based controller-monitored

system is leading inevitably to reduced safety and efficiency, and less orderly regulation in the movement of air traffic in the U S The factors against ground-controlled ATC are examined and a detailed analysis of the adverse elements is conducted G R

A75-41703 **Air safety - The view from the cockpit.** W B Cotton (International Federation of Air Line Pilots Association, Washington, D C) *IEEE Spectrum*, vol 12, Aug 1975, p 71-74

The review of air safety control trends is centered on the effects of an automation program, known as the Upgraded Third Generation Air Traffic Control System (UG3RD), should it be implemented, on current air-to-air separation standards, and on navigation, surveillance, and communications A critical discussion of the UG3RD shows that the system not only will do nothing to improve a pilot's capability to plan or execute more economical flight paths, but it will erode the pilot's ability to direct those paths Moreover, the design of flow control, metering and spacing, and ATC communications by data link decreases the pilot's awareness of the outside environment (weather phenomena, geographical position, near-term future flight path, and relationship to other aircraft in the area) The most serious criticism of the UG3RD relates to the implied philosophy of control and the location of responsibility V P

THEORETICAL AND EXPERIMENTAL STUDY OF A NEW METHOD FOR PREDICTION OF PROFILE DRAG OF AIRFOIL SECTIONS

S H Goradia and D E Lilley Washington NASA Jun 1975 166 p refs

(Contract NAS1-12170)

(NASA-CR-2539) Avail NTIS HC \$6 25 CSCL 01A

Theoretical and experimental studies are described which were conducted for the purpose of developing a new generalized method for the prediction of profile drag of single component airfoil sections with sharp trailing edges. This method aims at solution for the flow in the wake from the airfoil trailing edge to the large distance in the downstream direction. The profile drag of the given airfoil section can then easily be obtained from the momentum balance once the shape of velocity profile at a large distance from the airfoil trailing edge has been computed. Computer program subroutines have been developed for the computation of the profile drag and flow in the airfoil wake on CDC6600 computer. The required inputs to the computer program consist of free stream conditions and the characteristics of the boundary layers at the airfoil trailing edge or at the point of incipient separation in the neighborhood of airfoil trailing edge. The method described is quite generalized and hence can be extended to the solution of the profile drag for multi-component airfoil sections. Author

PREDICTION OF THE STEADY AERODYNAMIC LOADS OF LIFTING SURFACES HAVING SHARP-EDGE SEPARATION
 Ph D Thesis

Osama A Kandil 1974 165 p

Avail Univ Microfilms Order No 75-15877

A nonplanar discrete-vortex technique was developed. The method is capable of obtaining the shapes of the wakes emanating from the sharp edges (e.g. the trailing edge, wing tip and leading edge) as part of the solution. The distributed and total aerodynamic loads on the lifting surfaces were predicted without restrictions on aspect ratios, angles of attack (as long as vortex bursting or boundary-layer separation on the wing surface did not occur), and planforms. The effect of thickness and level angle of the sharp edges was taken into account using two nonplanar vortex lattices, one on each surface of the wing. The technique was extended to solve the problem of interacting lifting surfaces. Rectangular, swept-back and delta wings are presented as numerical examples. The results show the problem of interacting lifting surfaces to be in qualitative agreement with the experimental observations. Dissert Abstr

CALCULATION METHODS FOR THE FLUTTER OF AIRCRAFT WINGS AND EXTERNAL STORES

T Niblett and J C A Baldock. In AGARD Specialists Meeting on Wing-With-Stores Flutter. Apr 1975 7 p-refs

Theoretical work at RAE on the wing-with-stores problem is reported which was in the fields of structural representation, the solution of the flutter equations and the prediction of flutter characteristics from structural properties. The subjects covered are: (1) a comparison of the normal modes calculated for a wing-with-stores from some of the normal modes of the bare wing and discrete-load-modes with those calculated from the full flexibility matrix, (2) the basis of a computer program which traces the loci of constant flutter speeds when two structural parameters vary, and (3) the interpretation of the loci of constant flutter speed in terms of modal shapes and frequencies with the object of assessing the most critical store combinations. FLUTTER OF WINGS EQUIPPED WITH LARGE ENGINES IN POD

R Destuynder. In AGARD Specialists Meeting on Wing-With-Stores Flutter. Apr 1975 12 p refs. In FRENCH, ENGLISH summary.

Calculations and measurements of unsteady aerodynamic forces performed in subsonic flow on a model equipped with an engine in pod showed that the interference between engine and wing remains negligible. It was also shown that the aerodynamic forces induced on the engine itself by its own oscillation are important and give a significant contribution to the generalized forces. Account was taken of these two remarks and the aerodynamic forces were calculated separately on the engine which was assimilated to a thin walled cylinder with internal and external flow in the axial direction. An application to a flutter case shows the importance of the contribution of the forces on the engine. A good agreement was obtained between theory and experiment at Mach number M = 0.80. Author

CALCULATION OF AERODYNAMIC LOADS ON OSCILLATING WING/STORE COMBINATIONS IN SUBSONIC FLOW

B Bennekers, R Roos and R J Zwaan. In AGARD Specialists

Meeting on Wing-With-Stores Flutter Apr 1975 13 p refs

A method for the calculation of aerodynamic loads on wing-store configurations oscillating in subsonic flow is presented in this method the linearized equation for subsonic compressible flow is transformed into two sets of integral equations for the steady and a superimposed unsteady flow field. The wing loads are represented by dipole distributions (wing thickness is neglected) and the store loads by source distributions. Discretizing these distributions into lifting lines and source panels of constant strength results into a set of algebraic equations. These are solved for the unknown distributions by forcing the flow to be tangential to the surfaces of the oscillating wings and bodies in a set of control points. The solution enables the calculation of pressure distributions on the wings and stores and of generalized aerodynamic coefficients. Calculated results are presented and compared with experiments. A PARAMETRIC STUDY OF WING STORE FLUTTER

L Chesta /In AGARD Specialists Meeting on Wing-With-Stores Flutter Apr 1975 12 p refs

The influence of different parameters on the flutter of wings with stores was studied in more than 3000 wind tunnel configurations. The parameters studied include store mass, store radius of inertia, store c.g., pylon pitch stiffness, and wing sweep angle. Results indicate (1) Flutter is induced by the coupling of the wing fundamental bending and the store pitch modes (2) Flutter speed decreases with increasing store radius of inertia until the frequency of the store pitch mode is higher than that of the fundamental bending (3) For all sweep angles the forward c.g. shifting produces a slight reduction of the minimum flutter speed. RECENT ANALYSIS METHODS FOR WING-STORE FLUTTER

Walter J Mykytow /In AGARD Specialists Meeting on Wing-With-Stores Flutter Apr 1975 15 p refs

A summary of a brief review for some of the literature on the practical aspects of wing-store flutter prediction and prevention. Brief comments are given on the advantages and disadvantages of various aspects of analytical and test procedures. Descriptions of improved analytical procedures developed for the United States Air Force is then given. Two methods are described in some detail and the results of the investigators are outlined. One is a rapid special purpose wing-store flutter analysis program called FACES. It has data storage and retrieval capabilities which together with a diagnostic and interpolation/extrapolation procedure estimate the flutter speed of new similar stores. The system can be coupled to a cathode ray tube to increase man/machine interaction and reduce decision times. The other analysis method described is based on the perturbation approach. Computation times can be reduced 90% by using the previously available data. The method produces good results when the mass or stiffness changes are small so that in turn, eigenvalue and eigenvector changes are small. A graph of flutter speed versus important parameters can be produced in one minute on a modern computer. Author

ANALYTICAL SIMULATION OF THE FAR-FIELD JET NOISE AND THE UNSTEADY JET FLOW-FIELD BY A MODEL OF PERIODIC SHEDDING OF VORTEX RING FROM THE JET EXIT Final Technical Report

Chen-Huei Liu Aug 1975 4 p

(Grant NSG-1144)

(NASA-CR-143211 TR-75-T10) Avail NTIS HC \$3.25 CSCL 01A

The construction of a theoretical flow field due to shedding of vortex rings, the identification of the controlling parameters, and the determination of whether the theoretical model successfully simulated the unsteady pressure field near jet (and consequently the far field noise) was studied. The basic parameters contained in the analytic solutions were the epoch at which a vortex ring was shed near the jet exit and the eddy viscosity coefficient. These parameters were identified from the experimental data for the real-time pressure and from the spread of the mixing layer of the jet. Results of the theoretical analysis show good qualitative agreement with the experimental data. Author

OPTIMUM PERFORMANCE AND POTENTIAL FLOW FIELD OF HOVERING ROTORS Final Report

J C Wu and R K Sigman May 1975 95 p refs Sponsored in part by Army Air Mobility R and D Lab Moffett Field Calif

(Contract NAS2-6340)

(NASA-CR-137705) Avail NTIS HC \$4.75 CSCL 01A

Rotor and propeller performance and induced potential flowfields were studied on the basis of a rotating actuator disk concept with special emphasis on rotors hovering out of ground effect. A new theory for the optimum performance of rotors hovering OGE is developed and presented. An extended theory for the optimum performance of rotors and propellers in axial motion is also presented. Numerical results are presented for the optimum distributions of blade-bound circulation together with axial inflow and ultimate wake velocities for the hovering rotor over the range of thrust coefficient of interest in rotorcraft applications. Shapes of the stream tubes and of the velocities in the slipstream are obtained, using available methods, for optimum and off-optimum circulation distributions for rotors hovering in and out of ground effect. A number of explicit formulae useful in computing rotor and propeller induced flows are presented for stream functions and velocities due to distributions of circular vortices over axis-symmetric surfaces. **LOW-SPEED UPWASH INTERFERENCE ON A TRANSPORT
MODEL IN A RECTANGULAR SLOTTED-WALL WIND
TUNNEL**

Michael J Mann Washington Aug 1975 25 p refs
(NASA-TM-X-3218 L-10042) Avail NTIS HC \$3 25 CSCL
01A

A study was made of the upwash interference caused by the wind tunnel walls at a Mach number of 0.20. The wind tunnel has slotted horizontal walls and solid vertical walls and the wind tunnel model is a wing-fuselage combination typical of a short take-off and landing (STOL) transport. Measurements were made of the model forces and angle of attack. The experimental results are compared to theoretical solutions for the upwash interference. This comparison enabled an indirect determination of one of the constants in the slotted wall boundary condition. The magnitude of the experimental upwash interference is also compared to the accuracy of the data. This comparison indicates that it is difficult to make definite conclusions based on the experimental data. Suggestions are made for future research which could provide a practical means of accurately determining the wall-interference velocities in wind tunnels with rigid slotted walls. Author

**EFFECT OF VERTICAL-TAIL LOCATION ON THE AERODY-
NAMIC CHARACTERISTICS AT SUBSONIC SPEEDS OF A
CLOSE-COUPLED CANARD CONFIGURATION**

Jarrett K Huffman Washington Aug 1975 49 p refs
(NASA-TN-D-7947 L-9961) Avail NTIS HC \$3 75 CSCL
01A

The effects were studied of various vertical-tail configurations on the longitudinal and lateral directional-stability characteristics of a general research fighter model utilizing wing-body-canard. The study indicates that the addition of the high canard resulted in an increase in total lift at angles of attack above 4 deg with a maximum lift coefficient about twice as large as that for the wing-body configuration. For the wing-body (canard off) configuration the center-line vertical tail indicates positive vertical-tail effectiveness throughout the test angle-of-attack range; however, for this configuration none of the wing-mounted vertical-tail locations tested resulted in a positive directional-stability increment at the higher angles of attack. For the wing-body-canard configuration several outboard locations of the wing-mounted vertical tails were found. Author

**PRESSURE DISTRIBUTIONS ON A CAMBERED WING
BODY CONFIGURATION AT SUBSONIC MACH NUM-
BERS**

William P Henderson Washington Jul 1975 151 p refs
(NASA-TN-D-7946 L-10105) Avail NTIS HC \$6 25 CSCL
01A

An investigation was conducted in the Langley high-speed 7- by 10-foot tunnel at Mach numbers of 0.20 and 0.40 and angles of attack up to about 22 deg to measure the pressure distributions on two cambered-wing configurations. The wings had the same planform (aspect ratio of 2.5 and a leading-edge-sweep angle of 44 deg) but differed in amounts of camber and twist (wing design lift coefficient of 0.35 and 0.70). The effects of wing strake on the wing pressure distributions were also studied. The results indicate that the experimental chordwise pressure distribution agrees reasonably well with the design distribution over the forward 60 percent of nearly all the airfoil sections for the lower cambered wing. The measured lifting pressures are slightly less than the design pressures over the aft part of the airfoil. For the highly cambered wing there is a significant difference between the experimental and the design pressure level. The experimental distribution however is still very similar to the prescribed distribution. At angles of attack above 12 deg the addition of a wing-fuselage strake results in a significant increase in lifting pressure coefficient at all wing stations outboard of the strake-wing intersection. 01A

An analytical approach is presented to account for some of the nonlinear characteristics of the transonic flow equation for finite thickness wings undergoing harmonic oscillation at sonic flight speed in an inviscid shock-free fluid. The thickness effect is accounted for in the analysis through use of the steady local Mach number distribution over the wing at its mean position by employing the local linearization concept and a coordinate transformation. Computed results are compared with that of the linearized theory and experiments. Based on the local linearization concept, an alternate formulation avoiding the limitations of the coordinate transformation method is presented. Author

GENERAL PRINCIPLES AND MATHEMATICAL MODELS
G J Hancock In Aeron Res Council On the Appl of Subsonic
Linearised Wing Theory to Second-Order Forces and Moments
1975 p 5-32 refs
Copyright

The mathematical formulation of linearized finite wing theory in low speed steady flow is introduced and discussed. The lifting surface model in which the vorticity is placed on a planar surface, is shown to lead to inconsistent results. Consistent results are obtained when the vorticity is placed on the camber surface analysis involving the Trefftz plane. The side force and yawing moment are derived from approximate expressions which avoid calculation of any edge forces. Author (ESRO)

EDGE FORCES AND ROLL-RATE DERIVATIVES
H C Garner In Aeron Res Council On the Appl of Subsonic
Linearised Wing Theory to Second-Order Forces and Moments
1975 p 33-65 refs
Copyright

The analysis of linearized subsonic lifting surface theory is extended to provide expressions for the leading edge and side edge forces. The side force and yawing moment under conditions of asymmetric spanwise loading are obtained as the sum of three contributions: normal pressures, leading edge suction and tip suction. These quantities are used to treat lifting wings in roll. General trends in the theoretical derivatives are observed. The related evidence from experiment and from semi-empirical methods is discussed and one such method is transcribed for use in conjunction with the theoretical computations. Much of the nonlinear experimental behavior of the side force and yawing moment due to rate of roll can be accounted for by the removal of an increasing proportion of the theoretical edge forces as the lift increases. (NASA-TN-D-8000, L-10149) Avail NTIS HC \$3.25 CSCL 01C

A survey of commercial helicopter-operating experiences was conducted using a helicopter flight recorder in order to provide a basis for extending helicopter design and service-life criteria. These data are representative of 182 flight hours accumulated during 1414 flights comprised of the separate legs of the total route structure employed. The operating experiences are presented in terms of the time spent within different airspeed brackets, within the classifiable flight conditions of climb en route and descent at various rates of climb and descent, and at different rotor rotational speeds. The results indicated that the helicopter spent a majority of the flight time at airspeeds either below 40 knots or above 100 knots. Rates of climb and descent were concentrated at values below 5.1 m/s (1000 ft/min) particularly for higher airspeeds. Normal acceleration experiences were low both in the total number and peak value realized, however, an extremely large number of pitch angular-velocity experiences were noted. Rotor rotational speeds were normal with no occurrences above the upper red-line limit. Author

APPLICATION OF ACTIVE CONTROLS TECHNOLOGY TO THE NASA JET STAR AIRPLANE Final Report

R H Lange, J F Cahill, M C Campion, E S Bradley, D G MacWilkinson and J W Phillips Washington NASA Jun 1975 206 p refs

(Contract NAS4-2121)

(NASA-CR-2561 H-868) Avail NTIS HC \$7.25 CSCL 01C

The feasibility was studied of modifying a Jet Star airplane into a demonstrator of benefits to be achieved from incorporating active control concepts in the preliminary design of transport type aircraft. Substantial benefits are shown in terms of fuel economy and community noise by virtue of reduction in induced

drag through use of a high aspect ratio wing which is made possible by a gust alleviation system. An intermediate configuration was defined which helps to isolate the benefits produced by active controls technology from those due to other configuration variables. Also an alternate configuration which incorporated composite structures, but not active controls technology was defined in order to compare the benefits of composite structures with those of active controls technology. THE INFLUENCE OF ENGINE/TRANSMISSION/GOVERNOR ON TILTING PROPROROTOR AIRCRAFT DYNAMICS

Wayne Johnson Jun 1975 27 p refs Prepared in cooperation with Army Air Mobility R and D Lab Moffett Field Calif (NASA-TM-X-62455) Avail NTIS HC \$3.75 CSCL 01C

An analytical model is developed for the dynamics of a tilting proprotor aircraft engine and drive train including a rotor speed governor and interconnect shaft. The dynamic stability of a proprotor and cantilever wing is calculated, including the engine-transmission-governor model. It is concluded that the rotor behaves much as if windmilling as far as its dynamic behavior is concerned with some influence of the turboshaft engine inertia and damping. The interconnect shaft has a significant influence on the antisymmetric dynamics of proprotor aircraft. The proprotor aerodynamics model is extended to include reverse flow and a refinement on the method used to calculate the kinematic pitch-bending coupling of the blade is developed. Author

WEAPON SYSTEM COSTING METHODOLOGY FOR AIRCRAFT AIRFRAMES AND BASIC STRUCTURES VOLUME 2 SUPPORTING DESIGN SYNTHESIS PROGRAMS Technical Report, Jul 1972 - Dec 1973

R E Kenyon Sep 1974 73 p refs (AF Proj 1368) (AD-A005426 AFFDL-TR-73-129-Vol-2) Avail NTIS CSCL 01/3

This volume describes the supporting programs used in conjunction with a cost estimating program to provide a trade study cost estimating technique for aerodynamic surfaces. The supporting programs for the purpose of this discussion are defined as a structural synthesis program and a secondary structure synthesis program. The structural synthesis program is used for the analysis of primary structure and is called APAS (Automated Program for Aerospace-Vehicle Synthesis). The secondary structure synthesis program estimates geometry and weights and performs parts definition for the aerodynamic surface leading edge trailing edge and tip components. The cost estimating adaptation is derived from programs originally developed under Independent research and development. GRA

CRASHWORTHY HELICOPTER GUNNER'S SEAT INVESTIGATION Final Report

Mason J Reilly Jan 1975 255 p refs (Contract DAAJ02-73-C-0021 DA Proj 1F2-62209-AH-76) (AD-A005563 D210-10840-1 USAAMRDL-TR-74-98) Avail NTIS CSCL 01/3

The poor crash-impact performance of seats designed to current military specifications was revealed by the U S Army in the early 1960s. It was discovered that numerous seat occupants were being injured during moderate impacts because of inadequate upper torso restraint inadequate seat strength, absence of any meaningful vertical crash-force attenuation, and inadequate testing criteria. Following extensive design and testing efforts improved crashworthiness design and testing criteria were developed for Army aircraft seating systems. GRA

MAJOR ITEM SPECIAL STUDY (MISS), UH-1H MAIN ROTOR HUB ASSEMBLY Interim Report, Jan 1964 - Dec 1973

Jan 1975 21 p (AD-A005217 USAAVSCOM-TR-74-54) Avail NTIS CSCL 01/3

Major Item Special Study (MISS) reports are performed on DA Form 2410 reportable components. These are time change items and certain condition change items selected because of high cost or need for intensive management. Basically, the MISS

reports are concerned with analyzing reported removal data presented in the Major Item Removal Frequency (MIRF) report. The failure modes reported for each removal are examined and grouped into categories which are intended to clarify the intent of the data reporting. From this data removal distribution can be plotted and an MTR (mean time to removal) can be calculated. The MISS reports then investigate possible cost savings based on total elimination of selected failure modes. These modes are chosen because of the percentage of failures they represent and/or because they appear to be feasible Product Improvement Program (PIP) areas. GRA

ARMY PRELIMINARY EVALUATION 1 RV-1D/QUICK LOOK 2 AIRCRAFT Final report

Gary L Bender and James C OConnor Aug 1974 26 p refs (AD-A005220 USAAEFA-74-36) Avail NTIS CSCL 01/3

The United States Army Aviation Engineering Flight Activity conducted a limited handling qualities evaluation of the RV-1D/Quick Look II aircraft manufactured by Grumman Aerospace Corporation. The aircraft was tested at the Grumman facility in Stuart Florida on 16 and 17 July 1974. Testing included stability and control and miscellaneous engineering tests necessary to verify the flight envelope. No deficiencies were found during these tests. Two shortcomings were identified: inadequate stall warning in the power-approach and landing configurations and the degraded single-engine performance and maneuvering capability caused by the inability to jettison the Quick Look II antenna pods. A DESIGN STUDY FOR A REMOTELY PILOTED VEHICLE, AUTOMATIC LANDING SYSTEM M S Thesis

Mark P Hadley Dec 1974 111 p refs (AD-A005285 GE/MA/74D-4) Avail NTIS CSCL 01/3

A method of control design is developed using optimal control theory which results in a simple and practical control system. The basis of this method is the elimination of unnecessary feedback gains which in turn allows most of the Kalman filter elements to be eliminated also. The procedure is developed by designing an automatic control system for a remotely piloted vehicle. The aircraft modeled in the study was the Ryan Compass Cope RPV. This aircraft has a low wing loading making it very susceptible to wind gusts. The problem is limited to the approach phase of landing under moderate to severe turbulence. Both longitudinal and lateral control systems are considered. GRA

NOISE ABATEMENT BY THE INTERACTION OF COLD COAXIAL MODEL JETS Ph D Thesis

Mahmound Salim Audi 1974 252 p Avail Univ Microfilms Order No 75-13958

The possibility of attenuation of noise from jets by inducing interaction between coaxial cold streams is assessed. These streams discharge from two or three nozzles of an assembly of three convergent nozzles whose exits are coplanar. The innermost nozzle is circular while the intermediate and the outermost are annular and all have the same exit area of 1104 sq in. The two interacting jets investigated here discharge from the innermost and the intermediate nozzles while the three interacting jets discharge from the three nozzles of the assembly. Throughout almost all of the investigation the reservoir pressure of the intermediate jet was maintained at 30 psig while the innermost jet reservoir pressure and the outermost jet reservoir pressure are varied systematically from 0 to 30 psig increments. The data gathered for this research includes both shadowgraphic records and far field noise surveys. Dissert Abstr

NOISE LEVELS IN THE CC-109, CC-115, AND CC-117 AIRCRAFT

S E Forshaw, R A Stong and R B Crabtree Sep 1974 18 p refs (DCIEM-74-R-1059) Avail NTIS HC \$3.25

The results of noise surveys in the CC-109 CC-115 and CC-117 aircraft, are reported and the effectiveness of current CF headsets in minimizing the risk of noise-induced hearing loss among the crews of these aircraft, was discussed. The H-157/AIC headset provides adequate protection for the crew of the CC-109 aircraft and for the pilots of the CC-115 aircraft. The navigator of the CC-115 however is located in an extremely noisy area of the aircraft and requires the added low frequency protection provided by the NX-10 headset. Pilots of the CC-117 aircraft do not require hearing protection and may prefer therefore, to wear a more comfortable headset such as the Airlite 71. Author

INTERIOR NOISE LEVELS OF TWO PROPELLER-DRIVEN LIGHT AIRCRAFT

John J. Catherines and William H. Mayes Jul 1975 21 p refs

(NASA-TM-X-72716) Avail NTIS HC \$3.25 CSCL 20A

The relationships between aircraft operating conditions and interior noise and the degree to which ground testing can be used in lieu of flight testing for performing interior noise research were studied. The results show that the noise inside light aircraft is strongly influenced by the rotational speed of the engine and propeller. Both the overall noise and low frequency spectra levels were observed to decrease with increasing high speed rpm operations during flight. This phenomenon and its significance is not presently understood. Comparison of spectra obtained in flight with spectra obtained on the ground suggests that identification of frequency components and relative amplitude of propeller and engine noise sources may be evaluated on stationary aircraft.

NUMERICAL SIMULATION OF TURBULENT JET NOISE, PART 1**

Ralph W. Metcalfe and Steven A. Orszag [1975] 75 p refs (Contract NAS1-12870)

(NASA-CR-132693 Rept-53) Avail NTIS HC \$4.25 CSCL 20A

Flow characteristics, such as quadrupole moments are examined in order to study generation of aerodynamic noise. The mean flow quantities are set in accordance with experimental data and the incompressible Navier-Stokes are solved numerically. Isolated downstream sections of a turbulent jet are modeled separately with the mean flow characteristics held constant in time. The flows are allowed to evolve until the fluctuating velocity components reach a statistically steady state. Cross section contour plots of the velocity components and the quadrupole moments at three different downstream positions are presented.

DIVERGENCE ELIMINATION WITH ADVANCED COMPOSITES Ph D Thesis**

Norris Jacob Krone, Jr. 1974 120 p

Avail Univ Microfilms Order No 75-14306

The ability to tailor material properties to suit a particular loading situation was studied. The structural characteristics of an airfoil and elimination of the structural weight penalty normally associated with divergence prevention for swept-forward airfoils, and a comparison using aluminum and composite wing designs of various sweep angles is presented. The optimization of each design to determine the minimum weight necessary to satisfy the loading condition and the divergence criteria imposed was also studied. The results of the study show the undesirability of using swept-forward wing designs which incorporate isotropic materials, and in marked contrast with its aluminum counterpart the composite structural weight variation with forward sweep is not found to be significant.

DEVELOPMENT AND EVALUATION OF HIGH-ENERGY BRAKE MATERIALS Ph D Thesis**

Ting-Long Ho 1974 132 p

Avail Univ Microfilms Order No 75-14943

An investigation was carried out to study and develop high temperature aircraft brake materials sliding against 17-22 AS steel. The requirements of brake materials were outlined and a survey made to select materials to meet these requirements. Based upon their physical and thermal properties, a number of metals and ceramic materials were selected and evaluated in sliding tests which simulated aircraft braking. These were nickel, molybdenum tungsten ZrO2 high temperature cements and carbons. Additives were then incorporated into these materials to optimize their wear or strength behavior with particular emphasis on nickel and molybdenum base materials and a high temperature potassium silicate cement. Optimum materials were developed which had improved wear behavior over conventional brake materials in the simulated test.

FORGING OF METAL-MATRIX COMPOSITES FORMING LIMIT CRITERIA AND APPLICATIONS TO PROCESS DESIGN Ph D Thesis**

R. Turgay Ertuerk 1975 132 p

Avail Univ Microfilms Order No 75-14402

Fundamental deformation and fracture behavior of fiber-reinforced metal-matrix composites were determined under conditions of simulated forging. Defects that occur during the forging of a sample material (2024 Al-alloy matrix reinforced with 25 v/o stainless steel wires) are characterized and criteria for their prediction and prevention established. These forming limit criteria, in combination with an analysis of metal flow during deformation processing, were used to develop a forging process for an airfoil shape. The design method developed based on the forming limit criteria, demonstrates a rational approach to the design of processes for forging complex shapes from composite materials. Utilizing this approach, process parameters (die and preform geometry, lubrication) can be evaluated for forging sound complex composite shapes.

Polymer and fiber materials for naval radome applications were investigated. The investigation was concerned with materials having low and stable dielectric constant and loss tangent properties. Primary emphasis was on polybutadiene polymers, with various other classes of polymers including thermoplastics being investigated as secondary candidates. A survey was conducted on the availability of polybutadiene polymers and a characterization study performed on 14 different resins from three manufacturers. Secondary resin candidates which included polysulfones, polyimides, polyphenylquinoxalines, and polyamide-imides, were evaluated. Composite processing studies were conducted for the more promising resin candidate materials. Investigations were conducted into fiber finishes and surface treatments compatible with the polybutadiene resin for both fiber reinforcements.

**FEASIBILITY STUDY FOR A DUAL FIELD OF VIEW-SINGLE
 DETECTOR ARRAY INFRARED SYSTEM Final Report**

Jun 1974 89 p

(Contract DAAK02-72-C-0419)

(AD-A005658) Avail NTIS CSCL 17/5

An analytical study was conducted to determine the feasibility
 of multiplexing two infrared images gathered by two separate
 lens systems, at a coincident focal plane thereby permitting
 utilization of only one infrared detector array for time shared
 processing of both images The study was primarily directed
 towards determining the feasibility and practicality of, dual image
 opto-mechanical scanning techniques and retaining flicker-free
 video presentations by storing and processing the multiplexed
 IR video The results of the study show that the concept is
 feasible and that hardware can be implemented by using
 state-of-the-art techniques The investigation into scanning
 techniques and data storage media indicates that the most
 suitable hardware implementation would consist of a Collimated
 Dual Galvanometer Optical Scanner and a Storage Refresh
 Memory using MOS Shift Registers GRA

EFFECTS OF REYNOLDS NUMBER AND ROUGHNESS ON C SUB Lmax

Nobuhiko Kamiya Masayoshi Nakamura Tadashi Itoh Hiroataka Itabashi and Miyuki Nomura Dec 1974 12 p refs *In* JAPANESE, ENGLISH summary
 (NAL-TR-396) Avail NTIS HC \$3 25

Maximum lift coefficient is one of the aerodynamic characteristics of a wing which it is very difficult to estimate from experimental data. It is observed in various experiments that $C_{sub} L_{max}$ increases with increasing Reynolds number. As Reynolds number increases the drag of a circular cylinder first decreases to a minimum value and then increases again to some constant value due to the corresponding movement of the separation point of the boundary layer. $C_{sub} L_{max}$ of an airfoil depends strongly on the location of the separation point, which is considered to move backward first and then forward as Reynolds number increases similarly to the case of the circular cylinder. Therefore it may be considered that $C_{sub} L_{max}$ increases first to a maximum value and then decreases. In order to verify this presumption, a preliminary experiment was made in a simple experimental setup with a two dimensional model, composed of a circular cylinder and a flap of Thwaites type at Reynolds numbers ranging from $4 \times 10,000$ to $4 \times 100,000$. It is demonstrated that $C_{sub} L_{max}$ of this model behaved as expected. Author

MEASUREMENT AND ANALYSIS OF UNSTEADY AERODYNAMIC FORCE FOR THE VERTICAL GUST ON AN AIRPLANE MODEL IN THE NAL GUST WIND TUNNEL

Hiroshi Nishimura, Hiroshi Matsushita Kiyomi Kitamura, and Yoshitaka Murakami Jan 1975 16 p refs *In* JAPANESE, ENGLISH summary
 (NAL-TR-399) Avail NTIS HC \$3 25

A vertical gust aerodynamic force study in a gust wind tunnel which has a 2 meter squared section and gust generation cascades is reported. Sinusoidal and random gusts of about 1 meter per sec vertical amplitude are applied on a semi rigid model of about 1.4 meter span fixed at the middle of the test section. Longitudinal tunnel flow is fixed at 20 meter per sec and experimental frequencies are 0.2 to 10 Hz. Parts of data are compared with theoretical calculation for tapered three dimensional wings. Results show wing/body/tail interferences for the complete tailless and wingless configurations. Author

TRANSONIC DATA MEMORANDUM. SECOND-ORDER METHOD FOR ESTIMATING THE SUBCRITICAL PRESSURE DISTRIBUTION ON A TWO-DIMENSIONAL AEROFOIL IN COMPRESSIBLE INVISCID FLOW

Dec 1973 22 p refs
 (ESDU-72025) Copyright Avail NTIS HC \$122 50

A method is presented accurate to second-order in thickness, camber and incidence, for estimating the subcritical pressure distribution on a two-dimensional aerofoil in compressible inviscid flow. A few examples are given of comparisons with a nominally-exact method and it is shown how the method differs from a first-order method widely used as the basis for the calculation of pressure distributions on finite swept wings and on two-dimensional aerofoils in compressible viscous flow. A critical evaluation of the second-order method has shown that over a wide range of aerofoil shapes incidence and Mach number, pressure distributions calculated by the second-order method differ appreciably from nominally-exact calculations only for local regions of aerofoils where high local surface curvature occurs and over the first 20 per cent, or so, of chord for aerofoils having the bluffer leading-edge profiles. Two suggested techniques for enumerating the method are outlined and reference is made to a computer program which was used to obtain results from the method. Author

THEORETICAL EFFECT OF MODIFICATIONS TO THE UPPER SURFACE OF TWO NACA AIRFOILS USING SMOOTH POLYNOMIAL ADDITIONAL THICKNESS DISTRIBUTIONS WHICH EMPHASIZE LEADING EDGE PROFILE AND WHICH VARY LINEARLY AT THE TRAILING EDGE
 Donald S Hague and Antony W Werz Mar 1975 32 p refs
 (Contract NAS2-8599)
 (NASA-CR-137717, TN-197) Avail NTIS HC \$3 75 CSCL 01A

An investigation was conducted on a CDC 7600 digital computer to determine the effects of additional thickness distributions to the upper surface of airfoils. The additional thickness distribution had the form of a continuous mathematical function which disappears at both the leading edge and the trailing edge. Results were obtained at a Mach number of 0.2 with an angle of attack of 6 deg. All calculations employed the full potential flow equations for two dimensional flow. The relaxation method of Jameson was used for solution of the potential flow equations. It is shown that increasing the thickness and variations in shape increases the lift and the adverse pitching moment coefficients. Author

UNSTEADY VORTEX LATTICE TECHNIQUES APPLIED TO

WAKE FORMATION AND PERFORMANCE OF THE STATICALLY THRUSTING PROPELLER

Gerald Forrest Hall [1975] 197 p refs
(Grant NGL-39-009-172)

(NASA-CR-132686) Avail NTIS HC \$7 00 CSDL 01A

The application is considered of vortex lattice techniques to the problem of describing the aerodynamics and performance of statically thrusting propellers. A numerical lifting surface theory to predict the aerodynamic forces and power is performed. The chordwise and spanwise loading is modeled by bound vortices fixed to a twisted flat plate surface. In order to eliminate any a priori assumptions regarding the wake shape, it is assumed the propeller starts from rest. The wake is generated in time and allowed to deform under its own self-induced velocity field as the motion of the propeller progresses. The bound circulation distribution is then determined with time by applying the flow tangency boundary condition at certain selected control points on the blades. The aerodynamics of the infinite wing and finite wing are also considered. The details of wake formation and roll-up are investigated particularly the localized induction effect. It is concluded that proper wake roll-up and roll-up rates can be established by considering the details of motion at the instant of start. Author

SHEAR AND MOMENT RESPONSE OF THE AIRPLANE WING TO NONSTATIONARY TURBULENCE**

Yoshinori Fujimori Jan 1975 13 p refs
(NAL-TR-404T) Avail NTIS HC \$3 25

Response formulation of the shear force and bending moment of the airplane wing was established in terms of evolutionary cross spectrum. Frequency distribution of the responses of arbitrary wing sections can be obtained at any time instant of interest after the airplane enters the nonstationary atmospheric turbulence. Conventional stationary solutions are included in this analysis as the special case. Contribution by the pitching motion is the highest to both shear and moment responses. The effect of the shear force to the stress level is negligibly smaller than that due to the bending moment. When the envelope profile looks like a step function, mean square moment takes the maximum in the transient stage whose spectrum is dominated by rigid modes. But the spectrum at stationary state, where its mean square moment is lower than the transient maximum, shows both rigid and flexible motions. Therefore, the search of the stationary solutions only is not adequate in view of ultimate strength and fatigue life of the airplane structure. Author

HIGHER ORDER WIND TUNNEL CORRECTIONS FOR A TWO-DIMENSIONAL CIRCULAR ARC LIFTING AEROFOIL IN A CLOSED RECTANGULAR WIND TUNNEL**

B W B Shaw Aug 1974 69 p refs

(ARL/A-Note-349) Avail NTIS HC \$4 25

A method is presented for solving the inviscid flow past a two-dimensional airfoil in a closed rectangular wind tunnel by determining an equivalent free-air flow field containing an independent vortex. Expressions for the tunnel corrections to the incidence and free-stream speed, and $C_{sub L}$, $C_{sub D}$, and $C_{sub m}$ are given for an infinitely thin circular arc cambered airfoil as quadratics in cord/tunnel height ratio (c/h). With centrally positioned airfoils, for values of c/h up to 0.3 first order theory predicts all the corrections with generally good accuracy (within 1/2% of the corrected quantity) except for delta $C_{sub D}$ near the stall. But for airfoils with even a small vertical offset for the corrections to $C_{sub L}$, $C_{sub D}$, and $C_{sub m}$, first order theory proves inaccurate, and the higher order equations should be used. Langley Research Center Langley Station, Va****EFFORT OF SPANWISE VARIATION OF TURBULENCE ON THE NORMAL ACCELERATION OF AIRPLANES WITH SMALL SPAN RELATIVE TO TURBULENCE SCALE**

Kermit G Pratt Aug 1975 37 p refs

(NASA-TM-X-72748) Avail NTIS HC \$3 75 CSDL 01A

A rigid airplane with an unswept wing is analyzed. The results show that the power spectrum, relative to that for a one-dimensional turbulence field, is significantly attenuated at the higher frequencies even for airplanes with arbitrarily small ratios of span to scale of turbulence. This attenuation is described by a simple weighting function of frequency that depends only on aspect ratio. The weighting function, together with the attenuation due to the unsteady flow of gust penetration, allows the determination of the average rate of zero crossings for airplanes having very small spans without recourse to an integral truncation which is often required in calculations based on a one-dimensional turbulence field. (NASA-TN-D-7923, L-9531) Avail NTIS HC \$4 25 CSDL 05H

Accelerations in the lateral and vertical directions were measured at two locations on the floor of a three-jet-engine aircraft and at two locations on the floor of a two-jet-engine aircraft during a total of 13 flights, each of which included taxiing, takeoff, ascent, cruise, descent, and landing. Accelerations over the frequency range 0 to 25 Hz were recorded continuously on magnetic tape and were synchronized with the VGH recorders in the aircraft so that vibratory accelerations could be correlated with the operating conditions of the aircraft. From the results it was indicated that the methodology used in segmenting the data, which were obtained in a continuous and repetitive manner, contributes to establishing baseline data representative of the flight characteristics of aircraft. Significant differences among flight conditions were found to occur. The lateral accelerations were approximately 15 percent of the vertical accelerations during flight but as much as 50 to 100 percent of the vertical accelerations during ground operations. The variation between the responses of the two aircraft was not statistically significant. The results also showed that more than 90 percent of the vibratory energy measured during flight occurred in the 0- to 30-Hz frequency range. Generally the vibration amplitudes were normally distributed. Author

Terry L Holst and John C Tannehill Jul 1975 169 p refs
(Grant NGR-16-002-038)

(NASA-CR-143312, ISU-ERI-Ames-75169) Avail NTIS HC \$6 25 CSDL 01A

A time-marching finite-difference method was used to solve the compressible Navier-Stokes equations for the three-dimensional wing-leading-edge shock impingement problem. The

bow shock was treated as a discontinuity across which the exact shock jump conditions were applied. All interior shock layer detail such as shear layers, shock waves, jets, and the wall boundary layer were automatically captured in the solution. The impinging shock was introduced by discontinuously changing the freestream conditions across the intersection line at the bow shock. A special storage-saving procedure for sweeping through the finite-difference mesh was developed which reduces the required amount of computer storage by at least a factor of two without sacrificing the execution time. Numerical results are presented for infinite cylinder blunt body cases as well as the three-dimensional shock impingement case. The numerical results are compared with existing experimental and theoretical results. Author

EXTRACTION FROM FLIGHT DATA OF LONGITUDINAL AERODYNAMIC COEFFICIENTS IN MANEUVERING FLIGHT FOR F-8C AIRCRAFT

William T Suit Washington Aug 1975 41 p refs
 (NASA-TN-D-8019 L-10026) Avail NTIS HC \$3.75 CSCI 01A

Flight-test data were used to extract the longitudinal aerodynamic parameters of the F-8C aircraft. The aircraft was trimmed in a steady turn at angles of attack of approximately 9 deg and 13 deg at Mach numbers of 0.7 and 0.8. The parameters extracted resulted in a good match to the flight data and the values obtained were reasonable. The values were further verified by comparing the period and time to damp to half-amplitude as calculated by using the extracted parameter values with the period and time to damp to half-amplitude actually measured from the flight data traces. These results show that for the set of data examined, a mathematical model using linear aerodynamics was adequate to describe the response motions at the test angles of attack. Author

THE PREDICTION OF BOUNDARY-LAYER BEHAVIOR AND PROFILE DRAG FOR INFINITE YAWED WINGS PART 2 FLOW NEAR A TURBULENT ATTACHMENT LINE

B G J Thompson London Aeron Res Council 1974 46 p refs Supersedes RAE-TR-73091 ARC-35095
 (ARC-CP-1308 RAE-TR-73091 ARC-35095) Avail NTIS HC \$3.75 HMSO £1.10 PHI \$4.30

Calculations using the entrainment method Thompson and MacDonald show that even at flight Reynolds numbers a conventional swept wing with turbulent attachment line flow is affected by a prolonged region of reverse transition. Simple assumptions were used to estimate the effect of this on boundary-layer development. It is found that the profile drag is affected by several per cent, and it is thought that the shock-induced separation and scale effects for peaky transonic airfoils would be even more susceptible to the presence of laminar reversion, and that the use of an attachment line criterion for turbulent flow (such as C^*) is inadequate on its own. Calculations using the same boundary-layer method were made to provide charts from which a basic experiment at low speeds can be designed to investigate these problems on a yawed circular cylinder. Author (ESRO)

THE PREDICTION OF BOUNDARY-LAYER BEHAVIOUR AND PROFILE DRAG FOR INFINITE YAWED WINGS PART 1 A METHOD OF CALCULATION

B G J Thompson and A G J Macdonald London Aeron Res Council 1974 66 p refs Supersedes RAE-TR-73092 ARC-35096
 (ARC-CP-1307-Pt-1 RAE-TR-73092 ARC-35096) Avail NTIS HC \$4.25, HMSO £1.55 PHI \$6.25

Cumpsty and Heads' entrainment method for turbulent boundary layers was extended to compressible flow using Green's compressibility assumptions. The laminar layer was predicted using Thwaites' method in the chordwise plane and Nash's method

spanwise. The Rott compressibility transformation was used, and the transition and wake assumptions are consistent with the two-dimensional profile drag method of Nash. The complete method suitable for use in making routine design calculations, is described briefly. The relationships between calculation time step length, and accuracy are considered for a practical infinite wing at transonic cruise conditions. The global iteration technique is shown to fail in regions of favorable pressure gradient just downstream of the leading edge as correction terms involving derivatives of integral cross-flow thicknesses are no longer small. A faster step-by-step numerical method was adopted to solve the differential equations of the integral turbulent boundary-layer method without convergence problems. Author (ESRO)

(ARC-CP-1309-Pt-3 RAE-TR-73090 ARC-35094) Avail NTIS HC \$4.25 HMSO £1.35 PHI \$5.30

An integral method was used to predict boundary-layer and wake behavior for a family of infinite yawed wings having a chordwise section NPL 3111 operating at its design point. Profile drag predictions show a smaller variation with yaw than a typical project office design method and the Reynolds number for incipient rear separation depends strongly on angle of yaw. Scale effect on loss of lift, due to viscous displacement of the potential flow, appears to be amplified by sweep.

The longitudinal and lateral stability derivatives of a slender wing and fin configuration (AGARD G standard model) were measured using rocket-launched free-flight models. Comparisons are made with theoretical estimates of the derivatives and with previous experimental results from models flying at near-zero lift. The derivatives showing the greatest dependence on angle of attack are derived. Results also show that the linear theories used for obtaining values of these same derivatives at zero lift are inadequate at transonic speeds. Author (ESRO)

THRUST/DRAG ANALYSIS FOR A FRONT FAN NACELLE HAVING TWO SEPARATE CO-AXIAL EXHAUST STREAMS

P G Street London Aeron Res Council 1975 39 p refs Supersedes NGTE-321 ARC-34645

(ARC-CP-1311 ARC-34645 NGTE-321) Avail NTIS HC \$3.75 HMSO 90p PHI \$3.65

The forces acting on and around a high by-pass ratio front fan nacelle are considered in the light of findings on thrust and drag definitions for jet engines. From these considerations, thrust and drag components which take account of mutual interference are defined. A technique for defining an afterbody or gas generator cowl drag in the presence of external flow, was derived and the experimental measurements required are listed. Example calculations using experimental data were used to demonstrate the technique. Author (ESRO)

FREE-FLIGHT MODEL DYNAMIC STABILITY MEASURE-

MENTS ON A NOT-SO-SLENDER WING/FIN COMBINATION AT ZERO AND SMALL LIFT, MACH NUMBER EQUALS 0.8 TO 2.0

G H Greenwood and Geraldine F Edwards London ARC 1975 61 p refs Supersedes RAE-TR-74054, ARC-35501 (ARC-CP-1315 RAE-TR-74054, ARC-35501) Avail NTIS HC \$4 25, HMSO £ 1 40 PHI \$5 80

Dynamic longitudinal and lateral stability measurements were made in free flight at zero and small lift. Agreement between experiment and theory is generally good but exceptions were found in the magnitude and variation of the pitching moment derivative and the pitch-damping derivative. The effect of adding a small fairing in simulation of the support-sting shroud on complementary wind tunnel models appears to be confined to those stability derivatives. Author (ESRO)

SECOND-ORDER SMALL-PERTURBATION THEORY FOR FINITE WINGS IN INCOMPRESSIBLE FLOW**

J Weber London Aeron Res Council 1975 53 p refs Supersedes RAE-TR-72171 ARC-34469 (ARC-R/M-3759 RAE-TR-72171 ARC-34469) Avail NTIS HC \$4 25, HMSO £ 2 80, PHI \$10 85

The incompressible second-order theory for two-dimensional airfoils was extended to finite swept wings. The flow field is represented by distributions of sources and lifting singularities on the chord surface which contains the chord at each spanwise station. The strength of the source distribution was obtained as the sum of the distribution from first-order theory and a correction was derived from the second-order boundary condition. This involves the computation of the velocity which planar singularity distributions induce on and off the plane, the computation was done by computer programs. A generally applicable solution is derived and using Taylor series expansions this solution was simplified for the part of the wing away from center and tip. The problem of designing a wing of given thickness distribution (which has a prescribed pressure distribution on the upper surface) is also treated. Author (ESRO)

A TECHNIQUE FOR ANALYSING THE RESULTS OF A FLUTTER CALCULATION

J C A Baldock London Aeron Res Council 1975 36 p ref Supersedes RAE-TR-73168, ARC-35211 (ARC-R/M-3765, RAE-TR-73168 ARC-35211) Avail NTIS HC \$3 75 HMSO £ 1 90 PHI \$7 65

A technique is presented for condensing a multi-degree-of-freedom flutter calculation so that similar flutter conditions are achieved with two degrees-of-freedom. Digital computer programs were used, and the process is largely automatic. Examples of the application of the technique are given which show that systems can often be reduced to two normal modes or to two orthogonal combinations of normal modes, and that these modes can be interpreted physically. A detailed analysis of one of the derived two degree-of-freedom systems is made using a method restricted to a binary system. The condensation technique made possible the application of this method. THE COMPUTATION OF AERODYNAMIC LOADS ON HELICOPTER BLADES IN FORWARD FLIGHT, USING THE METHOD OF THE ACCELERATION POTENTIAL

T van Holten Mar 1975 131 p refs (VTH-189) Avail NTIS HC \$5 75

A description of the flow field is presented which is based on the acceleration potential. The use of the acceleration potential allows a relatively easy derivation of lifting line theory using a matched asymptotic expansion technique. The systematic rather than intuitive treatment of lifting line theory afforded by this approach enables one to derive the form which lifting line theory should assume in order to be applicable to the case of the helicopter rotor. Two theories were developed: the first one involves errors of relative order of magnitude A to the minus 2nd power (where A is the aspect ratio of the blades), the second one is a more elaborate higher order method involving relative errors of the order A to the minus 3rd power. If applied to the simpler case of the unswept wing in steady flow, these methods would reduce to Prandtl's classical method and to Weissinger's 3/4-chord method respectively. The matched asymptotic expansion analysis yields the complete pressure distribution over the blade's surface. Author (ESRO)

RESULTS OF AN AIRCRAFT VISIBILITY QUESTIONNAIRE CONCERNED WITH THE ESTIMATED BENEFITS OF AIRBORNE PROXIMITY WARNING INDICATOR SYSTEMS

Final Technical Report, Oct 1972 - Jan 1975

W Graham Jan 1975 152 p refs (Contract DOT-FA70WA-2263) (AD-A009884, FAA-RD-75-46) Avail NTIS HC \$6 25 CSCL 01/3

The aircraft visibility questionnaire was distributed in an attempt to estimate the flying habits of various classes of pilots with respect to flight rule and meteorological conditions, to determine the opinions of these pilots about matters concerning the potential usefulness of Proximity Warning Indicators (PWI) and to poll pilot preferences with respect to the display of PWI information. Pilots holding ATR and instrument ratings were sampled along with commercial and private pilots without instrument ratings, students and military pilots who held civil ratings. Estimates are given of the incidence of various meteorological conditions in 21 hubs in the U.S. and the percent of the time that pilots elect to fly instrument flight rules and visual flight rules under these conditions. Preferences of pilots for the relative bearing accuracy of PWI displays and for the type of display are reported. The mean time to abandon search failing detection after receipt of a traffic advisory is given as is the estimated time required to avoid an impending collision after detection of a threatening aircraft. VORTEX-RELATED ACCIDENTS OVER THE TEN YEAR PERIOD 1964 - 1973 Final Report
V P Gupta Apr 1975 82 p refs
(Contract DOT-FA70WA-2448)
(AD-A010111 FAA-EM-75-6, MTR-6852) Avail NTIS HC \$4 75 CSCL 01/2

Out of the approximately 45,000 aviation accidents that occurred over the ten-year period 1964-73, in the conterminous United States, wake vortices were cited as a cause or as factor in 147 accidents by the National Transportation Safety Board (NTSB). These vortex-related accidents were studied and categorized (by flight phases of the vortex-generating aircraft and the accident aircraft and other pertinent factors) with the objective of providing historical insight to the Wake Vortex Avoidance System (WVAS) development program, and to explore the possibility of procedural solutions to the vortex problem in various situations. The vortex problem was found to be largely confined to small general aviation aircraft landing or taking off close behind air carrier aircraft under VFR conditions. Landing behind another landing aircraft on the same runway was found to be the most frequent type of vortex-related accident. An intersection takeoff behind another takeoff from the threshold of the same runway was the second most frequent type. No intersection takeoff accident has, however, occurred since 1969 when a 3-minute separation rule was adopted for intersection takeoffs. Author

DABS LINK PERFORMANCE CONSIDERATIONS
G J Schliekert 28 Apr 1975 59 p refs
(Contracts DOT-FA72WAI-261, F19628-73-C-0002)
(AD-A009429 ATC-41, FAA-RD-74-186) Avail NTIS HC \$4 25 CSCL 17/7

The discrete address beacon system (DABS) link performance was computed using the present values for the system operating parameters and the available models that describe environmental and aircraft antenna effects. The various fade mechanisms are described and a statistical determination of performance is proposed. The performance is computed for various sets of conditions including different ground antennas, aircraft maneuvers antenna pedestal heights, ground reflection coefficients and reduced power. Also discussed are the effects of obstructions and the performance when aircraft are in the cone of silence. The DABS link is found to have good overall performance with only small regions of reduced reliability that are at low angles or due to maneuvers. Those missed replies due to maneuvers are found to be sporadic from scan to scan. Author

THEORETICAL PREDICTION OF AIRPLANE STABILITY DERIVATIVES AT SUBCRITICAL SPEEDS

J Tulinus, W Clever, A Nieman, K Dunn, and B Gaither [1973] 598 p refs
 (Contract NAS1-10828)
 (NASA-CR-132681, NA-72-803) Avail NTIS HC \$13 25 CSCL 01C

The theoretical development and application is described of an analysis for predicting the major static and rotary stability derivatives for a complete airplane. The analysis utilizes potential flow theory to compute the surface flow fields and pressures on any configuration that can be synthesized from arbitrary lifting bodies and nonplanar thick lifting panels. The pressures are integrated to obtain section and total configuration loads and moments due to side slip, angle of attack, pitching motion, rolling motion, yawing motion, and control surface deflection. Subcritical compressibility is accounted for by means of the Gothert similarity rule

ESTABLISHING CERTIFICATION/DESIGN CRITERIA FOR ADVANCED SUPERSONIC AIRCRAFT UTILIZING ACCEPTANCE, INTERFERENCE, AND ANNOYANCE RESPONSE TO SIMULATED SONIC BOOMS BY PERSONS IN THEIR HOMES Final Report

J E Mabry and P B Oncley Mar 1975 99 p refs
 (Contract DOT-FA74WAI-444)
 (AD-A009656 MAN-1010 FAA-RD-75-44) Avail NTIS HC \$5 25 CSCL 01/3

Community Noise Simulation Systems were designed and fabricated, and simulated sonic booms were introduced into the homes of twelve subject families. Acceptance, interference, and annoyance response data were obtained. Three boom levels and two frequency schedules (average of two or one per hour from 0700 to 2200 hours) are studied. It was concluded that for establishing a design/certification sonic boom threshold of acceptability for advanced supersonic transports, a level of 87 db (using S S Stevens' Mark VI) should be considered for indoor living with not more than fifteen daily boom exposures (no nighttime booms). It was also concluded that the realistic simulation approach developed utilizing Community Noise Simulation Systems is technically feasible and has high utility. It can be used to establish standards involving traffic noise, noise from airports, construction noise, and effects of industrial noise on surrounding communities

THE EFFECT OF WING DIHEDRAL AND SECTION SUCTION DISTRIBUTION ON VORTEX BURSTING

Karen E Washburn and Blair B Gloss Aug 1975 72 p refs
 (NASA-TM-X-72745) Avail NTIS HC \$4 25 CSCL 01A

Eleven semi-span wing models were tested in the 1/8-scale model of the Langley V/STOL tunnel to qualitatively study vortex bursting. Flow visualization was achieved by using helium filled soap bubbles introduced upstream of the model. The angle of attack range was from 0 deg to 45 deg. The results show that the vortex is unstable, that is, the bursting point location is not fixed at a given angle of attack but moves within certain bounds. Upstream of the trailing edge, the bursting point location has a range of two inches, downstream, the range is about six inches. Anhedral and dihedral appear to have an insignificant effect on the vortex and its bursting point location. Altering the section suction distribution by improving the triangularity generally increases the angle of attack at which vortex bursting occurs at the trailing edge

CONCEPTUAL DESIGN STUDY OF ADVANCED ACOUSTIC-COMPOSITE NACELLES

Kenneth E Nordstrom, Alan H Marsh, and Donald F Sargisson (GE) Jul 1975 200 p refs
 (Contract NAS1-13356)

(NASA-CR-132703, MDC-J6891) Avail NTIS HC \$7 00 CSCL 01C

Conceptual studies were conducted to assess the impact of incorporating advanced technologies in the nacelles of a current wide-bodied transport and an advanced technology transport. The improvement possible in the areas of fuel consumption, flyover noise levels, airplane weight, manufacturing costs, and airplane operating cost were evaluated for short and long-duct nacelles. Use of composite structures for acoustic duct linings in the fan inlet and exhaust ducts was considered as well as for other nacelle components. For the wide-bodied transport, the use of a long-duct nacelle with an internal mixer nozzle in the primary exhaust showed significant improvement in installed specific fuel consumption and airplane direct operating costs compared to the current short-duct nacelle. The long-duct mixed-flow nacelle is expected to achieve significant reductions in jet noise during takeoff and in turbo-machinery noise during landing approach. Recommendations were made of the technology development needed to achieve the potential fuel conservation and noise reduction benefits

LONGITUDINAL MOTIONS OF AIRCRAFT INVOLVING HIGH ANGLES OF ATTACK

H H B M Thomas and Joan Collingbourne London Aeron Res Council 1974 100 p refs Supersedes RAE-TR-73011, ARC-34703
 (ARC-R/M-3753 RAE-TR-73011 ARC-34703) Avail NTIS HC \$4 75 HMSO £4 85, PHI \$18 85

A general introduction is presented to the longitudinal motion of aircraft over an extended range of angle of attack and various aspects were investigated of the low-speed-deceleration maneuver with excursion of very high angles of attack in the case of failure to recover. The entry into such flight conditions of two distinct types of aircraft—one with a wing of moderately large aspect-ratio and having a high tailplane, the other, a tailless slender aircraft—is considered in some detail by examining the effect of various inputs on the motion. The factors influencing the ease with which control of the aircraft may be regained were studied particularly in cases in which normal recovery was achieved by forceful recovery action and those in which the aircraft only recovers after an excursion to extreme angles of attack. The possibility of recovery is found to depend on the general nature of the motion under the action of markedly nonlinear aerodynamic forces and moments. For aircraft having pitching-moment characteristics like those of the subject aircraft, three types of motion can follow an attempt at recovery. There can be a reduction to two or even one as outlined in the appendix. The problem of the stability of these motions was investigated

Examination of the allied single degree-of-freedom motion in pitch provides much insight into the more general problem, while phase-plane and similar three-dimensional plots prove useful means of displaying and interpreting results. The effect of varying the aircraft characteristics was examined. Various forms and levels of damping are considered as well as the more evident effects of the center-of-gravity position and the inertia-in-pitch of the aircraft. Author (ESRO)

MAJOR ITEM SPECIAL STUDY (MISS), UH-1H 90 DEGREE T/R GEAR BOX Interim Report, Jan 1964 - Jun 1974

Mar 1975. 21 p.
(AD-A006506, USAAVSCOM-TR-74-58) Avail NTIS CSCL 01/3

Major Item Special Study (MISS) reports are performed on DA Form 2410 reportable components. These are time change items and certain condition change items selected because of high cost or need for intensive management. Basically, the MISS reports are concerned with analyzing reported removal data presented in the Major Item Removal Frequency (MIRF) report. The failure modes reported for each removal are examined and grouped into categories which are intended to clarify the intent of the data reporting. From this data, removal distribution can be plotted and an MTR (mean time to removal) can be calculated. The MISS reports then investigate possible cost savings based on total elimination of selected failure modes. These modes are chosen because of the percentage of failures they represent and/or because they appear to be feasible Product Improvement Program (PIP) areas. GRA

OPTIMIZATION OF THE TIME BETWEEN AIRCRAFT OVERHAULS BY MINIMIZING MAINTENANCE COST Final Report

Shirley J. Smith, Florence A. Gaffney, Billy R. Schulze, D. Frank Fox, and Blaine T. Stone. Jan 1975. 70 p. refs.
(AD-A006505, USAAVSCOM-TR-74-53) Avail NTIS CSCL 01/3

The purpose of the study was to investigate the feasibility of determining when an aircraft should be overhauled in order to minimize the life time maintenance cost of the aircraft. It was assumed that the cost of field maintenance increases as the aircraft's flight hours increase. Also, it was assumed that following an overhaul, the cost rate drops significantly, then increases again until an overhaul. The total life time maintenance cost is the sum of all field maintenance costs and all overhaul costs. Then the optimum time between overhauls was found as that time for which the life time maintenance cost is a minimum. GRA

A DIRECT TIME HISTORY STUDY OF THE RESPONSE OF AN AIRPLANE TO NONSTATIONARY TURBULENCE Final Report, 15 Nov 1973 - 15 Jan 1975

John C. Houbolt and Guy Williamson. Jan 1975. 71 p. refs.
(Contract F33615-74-C-3006, AF Proj 1367)
(AD-A006159, ARAP-230, AFFDL-TR-74-148) Avail NTIS CSCL 01/1

Previous nonstationary turbulence studies are discussed. A novel way for evaluating the impulse response function for gust encounter is derived which automatically takes into account nonsteady lift and gust penetration effects. Various nonstationary gust fields, having spectral content and level exceedance behavior representative of atmospheric turbulence, are then synthesized, airplane response is evaluated in explicit time history form so that all transient effects are included. The generalized load exceedance curves derived from the time histories are compared with the results that are indicated by an existing technique which derives nonstationary results on the basis of local stationary encounters. SUMMARY OF MODEL VTOL LIFT FAN TESTS CONDUCTED AT NASA LEWIS RESEARCH CENTER

James H. Diedrich. 1975. 23 p. refs. Presented at Workshop on Prediction Methods for Jet V/STOL Propulsion Aerodynamics, Arlington, Va., 28-31 Jul 1975, sponsored by Naval Air Systems Command.
(NASA-TM-X-71778, E-8436) Avail NTIS HC \$3.25 CSCL 21E

The purpose of the tests was to obtain overall performance and influencing factors as well as detailed measurements of the internal flow characteristics. The first experiment consisted of crossflow tests of a 15-inch diameter fan installed in a two-dimensional wing. Tests were run with and without exit louvers over a range of tunnel speeds, fan speeds, and wing angle of attack. The wing was used for a study of installation effects on lift fan performance. The model tested consisted of three 5.5-inch diameter tip-turbine driven model VTOL lift fans mounted chord-wise in the two-dimensional wing to simulate a pod-type array. Several inlet and exit cover door configurations and an adjacent fuselage panel were tested. For the third program, a pod was attached to the wing and an investigation was conducted of the effect of design tip speed on the aerodynamic performance and noise of a 15-inch diameter lift fan-in-pod under static and crossflow conditions. Three single VTOL lift fan stages were designed for the same overall total pressure ratio but at three different rotor tip speeds. Author

APPLICATION OF REAL-TIME ENGINE SIMULATIONS TO THE DEVELOPMENT OF PROPULSION SYSTEM CONTROLS

J R Szuch 1975 13 p refs. Proposed for Presentation at 11th Propulsion Conf. Anaheim, Calif., 29 Sep - 1 Oct 1975, cosponsored by AIAA and SAE (NASA-TM-X-71764, E-8416) Avail NTIS HC \$3 25 CSCL 21E

The development of digital controls for turbojet and turbofan engines is presented by the use of real-time computer simulations of the engines. The engine simulation provides a test-bed for evaluating new control laws and for checking and debugging control software and hardware prior to engine testing. The development and use of real-time, hybrid computer simulations of the Pratt and Whitney TF30-P-3 and F100-PW-100 augmented turbofans are described in support of a number of controls research programs at the Lewis Research Center. The role of engine simulations in solving the propulsion systems integration problem is also discussed. Author

AIRCRAFT ENGINE SPEED AND FUEL FLOW SIGNAL CONDITIONER WITH DIGITAL OUTPUT

K F Fraser Nov 1974 44 p refs (ARL/ME-Note-354) Avail NTIS HC \$3 75

Engine speed and fuel flow rate sensors typically provide outputs in the form of a pulse train with repetition rate proportional to the measurand. Digitization of such data is readily accomplished by counting the number of pulses received per unit time. A conditioner which produces such digitization is described. It has the special property that no pulses are ever missed when the contents of the counter are transferred to associated data recording equipment. Thus the conditioner can be used for accurate totalizing or engine revolutions of fuel consumed over long periods. Author

ANNOYANCE RESULTING FROM INTRUSION OF AIRCRAFT SOUNDS UPON VARIOUS ACTIVITIES Final Technical Report

Walter J Gunn, William T Shepherd, and John L Fletcher (Memphis State Univ., Tenn.) 8 Aug 1975 85 p refs (Grant NGR-43-008-008) Avail NTIS HC \$4 75 CSCL 20A

An experiment was conducted in which subjects were engaged in TV viewing, telephone listening or reverie (no activity) for a 1/2-hour session. During the session they were exposed to a series of recorded aircraft sounds at the rate of one flight every 2 minutes. Within each session four levels of flyover noise, separated by dB increments, were presented several times in a Latin Square balanced sequence. The peak level of the noisiest flyover in any session was fixed at 95, 90, 85, 75, or 70 dBA. At the end of the test session, subjects recorded their responses to the aircraft sounds using a bipolar scale which covered the range from very pleasant to extremely annoying. Responses to aircraft noises were found to be significantly affected by the particular activity in which the subjects were engaged. Not all subjects found the aircraft sounds to be annoying. Author

TECHNICAL EVALUATION REPORT ON FLUID DYNAMICS PANEL SYMPOSIUM ON AIRFRAME/PROPULSION

E C Carter (Aircraft Res. Assoc. Bedford, Engl.) May 1975 14 p refs. Symp. held at Rome, 3-6 Sep 1974 (AGARD-AR-81) Avail NTIS HC \$3 25

Topics discussed at the symposium include air intakes and airframe inlet interactions, nozzles/afterbodies, flow field and airframe interference, wind tunnel testing and correlation with flight data, and integration design and accounting procedures. Main recommendations made are: there is urgent need for high quality afterbody pressure and force data; contradictory trends of drag with Reynolds number variation in wind tunnel and flight must be resolved; the need for extended wind tunnel Reynolds number capability is again demonstrated; engine simulator techniques require development and validation; theoretical treatment of mixing of afterbody and jet flows and of afterbody distortion effects must be extended; theoretical treatment of intake buzz requires development. NOISE SUPPRESSION WITH HIGH MACH NUMBER INLETS

Edward Lumsdaine, Jenn G Cherng, Ismail Tag, and Lorenzo R Clark (NASA Langley Res. Center) 15 Jul 1975 108 p refs (Grant NsG-1081)

(NASA-CR-143314) Avail NTIS HC \$5 25 CSCL 20A

The parameters affecting the aerodynamic and acoustic performance of high Mach number inlets using the translating centerbody and fixed geometry configurations were studied along with the effects of area ratio, length/diameter ratio, and lip geometry on the acoustic and aerodynamic performance when the rotor is at subsonic as well as supersonic tip speed. The results support earlier findings that the translating centerbody type inlet is superior to the collapsing cowl, both acoustically.

and aerodynamically especially at moderately high area ratios. The length/diameter ratio does not seem to be as crucial to performance near choked flow as area ratio. Inlets operating at high Mach numbers are more effective in reducing high frequency noise. At choked flow however the low frequency noise is also effectively reduced. It is shown that the actual amount of noise reduction depends on the flow downstream of the throat (pressure recovery) in contradiction to inviscid theory. Choking does not guarantee a large amount of noise reduction if it is accompanied by high pressure loss. Thus, without boundary layer control, choked inlets are area ratio limited. Using the test results, an empirical formula was derived, relating the noise reduction to percent of maximum mass flow and pressure recovery. Author

WIND TUNNEL TEST OF MODEL TARGET THRUST REVERSERS FOR THE PRATT AND WHITNEY AIRCRAFT JT8D-100 SERIES ENGINES INSTALLED ON A 727-200 AIRPLANE

D Hambly Sep 1974 157 p refs
(Contract NAS3-17842)
(NASA-CR-134709, D6-41900) Avail NTIS HC \$6.25 CSCL 21E

The results of a low speed wind tunnel test of 0.046 scale model target thrust reversers installed on a 727-200 model airplane are presented. The full airplane model was mounted on a force balance except for the nacelles and thrust reversers which were independently mounted and isolated from it. The installation had the capability of simulating the inlet airflows and of supplying the correct proportions of primary and secondary air to the nozzles. The objectives of the test were to assess the compatibility of the thrust reversers target door design with the engine and airplane. The following measurements were made: hot gas ingestion at the nacelle inlets, model lift, drag, and pitching moment, hot gas impingement on the airplane structure, and qualitative assessment of the rudder effectiveness. The major parameters controlling hot gas ingestion were found to be thrust reverser orientation, engine power setting, and the lip height of the bottom thrust reverser doors on the side nacelles. The thrust reversers tended to increase the model lift, decrease the drag, and decrease the pitching moment. Author

EVALUATION BY STEP RESPONSE TESTS OF PROTOTYPE RELIEF VALVES DESIGNED FOR YF-12 INLET STABILITY BLEED SYSTEM

Miles O Dustin and George H Neiner Washington Aug 1975 45 p refs
(NASA-TM-X-3262 E-8135) Avail NTIS HC \$3.75 CSCL 20D

Two stability bleed system relief valves were tested in a special dynamic test facility. These poppet valves are prototypes for a stability bleed system designed for use in a YF-12 flight inlet. One valve is unshielded, while the other has a special shield to eliminate the flow effect pressures on the piston. The tests determined the size of a damping orifice to be used during wind tunnel tests of the bleed system and verified an analog

simulation of the valves. The effects of initial pressure level, pressure step size and spring rate were investigated. Author

(NASA-TT-F-16367) Avail NTIS HC \$9.50 CSCL 21E

A generalization is presented for various methods of gas-turbine design including an evaluation of methods of gasdynamic calculation of turbine stages, methods of blade profiling, and methods of calculating cooled blades. The size and weight characteristics of a turbine and their dependence on the main engine parameters are considered, and the relation between gasdynamic and strength parameters of a turbine is discussed, with allowance for its structural features and fabrication technology, paying special attention to choice of the layout and dimensions of the air-gas flow area and to the profiling of both nozzle and rotor blades. To facilitate understanding of the theory, and number of examples of specific calculations based on given numerical values of the initial parameters are presented which pertain to single-stage and multistage gas turbines of turbojet engines. ENGINEERING SIMULATION EVALUATION OF THE TWO-SEGMENT NOISE ABATEMENT APPROACH IN THE DOUGLAS DC-8-61

W E Nylan 15 Apr 1974 26 p
(Contract NAS2-7475)
(NASA-CR-137665) Avail NTIS HC \$3.75 CSCL 20A

The development and operational evaluation are discussed of a noise abatement two-segment approach which is safe and operationally acceptable for routine use in air carrier service. An engineering simulation evaluation was conducted, it was found that the entry speed and initial configuration are more important in the DC-8-61 than in the 727 because of the DC-8's aerodynamic cleanliness and drag programming constraints. It was also found that the altitude required for the DC-8 upper and lower transitions is less than the 727 transitions principally due to the pitching moment from the underslung DC-8 engines as compared to the 727 engines which produce no pitching moment with a change in thrust. The 727 approach was a reduced flaps (30 degrees) procedure with a 10-knot airspeed bleed in the lower transition, the DC-8 approach is a full flaps (50 degrees) procedure with constant airspeed established as soon as possible after upper segment transition. Methods are presented for evaluating the technical flight characteristics of an aviation complex in terms of the efficiency with which operations are performed. A valid reduction of the operational model and its stages was performed using methods based on guaranteed evaluations under indeterminate conditions. An examination was made of problems of selecting criteria for flight operation efficiency, compiling maneuvers which are optimum in terms of effectiveness and formulating the trajectories as a whole. Methods are given for optimizing the trajectory in the case of additional relationships and limitations arising from the aircraft operation. Flight regimes programs and methods of controlling the aircraft when encountering or leaving a given point in space were examined

A SIMULATION STUDY OF ACTIVE FEEDBACK SUPPRESSION OF DYNAMIC RESPONSE IN HELICOPTER ROTOR BLADES Final Report

Daniel D Kana Roger L Bessey, and Franklin T Dodge 1 Jul 1975 76 p refs

(Contract NAS1-12974 SwRI Proj Q2-3895)

(NASA-CR-132711) Avail NTIS HC \$4 75 CSCL 01C

A parameter study is presented for active feedback control applied to a helicopter rotor blade during forward flight. The study was performed on an electromechanical apparatus which included a mechanical model rotor blade and electronic analog simulation of interaction between blade deflections and aerodynamic loading. Blade response parameters were obtained for simulated vortex impinging at the blade tip at one pulse per revolution, and for a pulse which traveled from the blade tip toward its root. Results show that the response in a 1 - 10-per-rev frequency band is diminished by the feedback action but at the same time responses at frequencies above 10-per-rev become

increasingly more prominent with increased feedback amplitude and can even lead to instability at certain levels. It appears that the latter behavior results from limitations of the laboratory simulation apparatus rather than genuine potential behavior for a prototype helicopter

A THROAT-BYPASS STABILITY SYSTEM FOR A YF-12 AIRCRAFT RESEARCH INLET USING SELF-ACTING MECHANICAL VALVES

Gary L Cole, Miles O Dustin, and George H Neiner 1975 14 p refs Proposed for presentation at 11th Propulsion on Conf Anaheim Calif, 29 Sep - 1 Oct 1975, cosponsored by AIAA and SAE

(NASA-TM-X-71779 E-8437) Avail NTIS HC \$3 25 CSCL 01C

Results of a wind tunnel investigation are presented. The inlet was modified so that airflow can be removed through a porous cowl-bleed region in the vicinity of the throat. Bleed plenum exit flow area is controlled by relief type mechanical valves. Unlike valves in previous systems these are made for use in a high Mach flight environment and include refinements so that the system could be tested on a NASA YF-12 aircraft. The valves were designed to provide their own reference pressure. The results show that the system can absorb internal-airflow transients that are too fast for a conventional bypass door control system and that the two systems complement each other quite well. Increased tolerance to angle of attack and Mach number changes is indicated. The valves should provide sufficient time for the inlet control system to make geometry changes required to keep the inlet started

AN IMPROVED SOURCE FLOW CHARACTERISTIC TECHNIQUE FOR THE ANALYSIS OF SCRAMJET EXHAUST FLOW FIELDS

P DelGuidice and S Dash May 1975 32 p refs

(Contract NAS1-13303)

(NASA-CR-132697, ATL-TR-213) Avail NTIS HC \$3 75 CSCL 20D

The process is discussed of designing a nozzle for a hypersonic airbreathing vehicle which involves a complex study of the inter-relationship among many parameters internal-external expansion vehicle lift, drag, pitching moments, and structural

and weight limitations. The source flow characteristic approach to the design process was extended and improved, and streamline interpolation procedure was incorporated. All characteristic and boundary calculations were made compatible with frozen, equilibrium and ideal gas thermodynamic options while slip surface calculations (cowl interaction) were extended to underexpanded flow conditions. Since viscous forces can significantly influence vehicle forces, pitching moments and structural/weight considerations, a local integration via flat plate boundary layer skin friction and heat transfer coefficients was included. These effects are calculated using the Spalding and Chi method, and all force and moment calculations are performed via integration of the local forces acting on the specified vehicle wetted areas. MEASUREMENTS AT THE LEeward SIDE OF A CONE AT LARGE INCIDENCES IN SUPERSONIC FLOW
 R Houwink Dec 1974 65 p refs
 (VTH-186) Avail NTIS HC \$4.25

The leeward flow field of a 7.5 deg half angle cone at incidences between 14 and 35 deg was investigated in a Mach 3 flow. The investigation was carried out in a supersonic blowdown wind tunnel. A qualitative investigation of the leeward flow structure at incidences between 16 and 25 deg using schlieren photographs and pitot tube transverses indicates a symmetric and approximately conical flow field with vortices and imbedded shockwaves. Above an incidence of about 28 deg the flow is nonconical and asymmetric. At these large incidences a steady asymmetric system of vortices seems to be present separating periodically with distance from the cone tip from the leeward cone surface. At angle of attack between 16 and 25 deg the distribution of flow properties in the leeward plane of symmetry was determined using pitot probes and a static pressure/directional wedge probe. Results indicate an expansion toward the cone surface, at incidences above 20 deg causing a conically supersonic velocity just above an oblique shockwave close to the leeward cone surface. The distribution of conical Mach number has a maximum value about halfway between the cone surface and the free stream direction. At incidences of 21.65 and 25 deg a vortical singularity-like stagnation point and a near-wake stagnation point are present. Author (ESRO)

A g-load measuring apparatus for facilitating pilot control of g-load during maneuvering and to provide an indication of g-load

constraint violations is proposed. The apparatus includes processing means for receiving the components of the linear acceleration and angular velocity of the aircraft and for generating the first output signal indicative of the critical velocity of the aircraft and a second output signal indicative of the instantaneous maneuvering velocity of the aircraft. Indicating means are connected to the processing means for receiving the two output generated signals such that the relative magnitude of the two signals is compared to provide an indication of the relative freedom of maneuverability of the aircraft and/or any g-load constraint violation that might exist.

The purpose of this program was the development of a reduced background infrared spectrometer to be installed on board a U-2 aircraft. It was expected that data obtained from the system would help resolve questions concerning long wavelength infrared plume emission mechanisms and specific radiating species in the 5 - 14 micrometer region. In addition to the spectrometer, the program required the development of a ground based data processing system for on-site quick look analysis of the data returned from the airborne spectrometer. The spectrometer designed and constructed under this program consisted of a rapid scanning, high spectral resolution Michelson interferometer operating at liquid nitrogen temperatures. The remaining support subsystems, including, the data processing system, the two axis stabilized gimbal tracking system, the airborne liquid nitrogen supply reservoir, and the interferometer control electronics were successfully completed. A GASP 4 SIMULATION OF TACTICAL AIR INTERDICTION USING A CHOICE OF WEAPONS LOADS AND CONTINUOUSLY CHANGING WEATHER CONDITIONS M S Thesis

Ronald G Bailey and Joseph R Szwarc Jan 1975 165 p refs
 (AD-A006349, SLSR-20-75A) Avail NTIS CSCL 15/7

The thesis simulates tactical air strike missions with a choice between unguided and laser-guided weapons. Weather at target point is known at a time prior to strike aircraft arrival. The simulation has a choice of three load decision rules: always load conventional, always load guided, or load aircraft with unguided versus guided bombs based on probability tables, using Markov chain principles, to estimate weather over target at n hours. Weather probability tables will dictate type of munition loaded. The actual weather at target is simulated using GASP IV, a computer language which allows continuous event simulation. GASP IV is used to simulate weather fronts moving toward target(s). The speed and distance between fronts is based on historical weather data. GASP IV changes the weather conditions at the target as a front moves over it. Strike results are based on actual weather, type of bomb loads, and the air defense at target. GRA

PRELIMINARY DESIGN STUDY OF A QUIET, HIGH FLOW FAN (QHF) STAGE

C L Walker L S Kisner R A Delaney, A A Beguhn and D E Frye 15 Oct 1974 74 p refs
 (Contract NAS3-18521)
 (NASA-CR-134780, EDR-8317) Avail NTIS HC \$4 25 CSCL 131

Concepts selected to reduce fan generated noise in a turbofan are presented. Near-sonic flow at the fan inlet to reduce upstream propagated noise and the use of long-chord vanes to reduce downstream noise is discussed. The near-sonic condition at the rotor inlet plane was achieved by designing for high specific mass flow and by maintaining the high flow at reduced power by variable stators and variable fan exhaust nozzle. The long-chord vanes reduce response to unsteady flow. The acoustic design showed that long-chord stators would significantly reduce turbofan source noise and that other stator design parameters have no appreciable effect on noise for the spacing and chord length of the turbofan design. Four rig flow paths studied in the aerodynamic preliminary design are discussed. Noise prediction results indicate that a turbofan powered aircraft would be under federal air regulations levels without any acoustic treatment. Author

FATIGUE DAMAGE EQUIVALENCE OF FIELD AND SIMULATED VIBRATIONAL ENVIRONMENTS Final Report, 1 Nov 1973 - 30 Dec 1974

Daniel D Kana and Dennis C Scheidt Nov 1974 54 p refs
 (Contract DAAD05-74-C-0729 SwRI Proj 02-3825)
 (AD-A006226) Avail NTIS CSCL 15/5

A method is developed for comparing the fatigue damage equivalence of field and laboratory simulated vibration environments. It involves the use of a model hardware specimen which is instrumented to record typical strain-time histories that occur in a given environment. The device is used to acquire data from both the field and corresponding laboratory simulation. The resulting strain-time histories are analyzed for fatigue damage potential. This analysis is based on the use of fatigue life gages. A mission ratio is defined for each pair of strain histories so that the degree of simulation achieved can be expressed in terms of the number of equivalent missions experienced. The technique is applied to OH-58A Helicopter, M-35 Truck, and M-113 Armored Personnel Carrier vehicle environments and their simulations. It is found that a typical uniaxial test simulation provides a rather poor duplication of the actual multi-axial field environments. GRA

DESERT STORAGE TEST PROGRAM Final Report, Jan 1972 - Feb 1974

William C Connors, John A Blind, and Leslie R Klein 20 Mar 1974 250 p refs
 (AD-A006103) Avail NTIS CSCL 01/3

This report examines long term aircraft preservation and storage procedures at the Military Aircraft Storage and Disposition Center Davis-Monthan Air Force Base, Arizona. It presents the Desert Storage Test Program conducted between January 1972 and February 1974. The best long term aircraft preservation process is discussed in terms of the storage related deterioration of aircraft. Special emphasis is placed on environmental conditions inside the aircraft during storage. GRA

FAILSAFE/SAFE-LIFE INTERFACE CRITERIA Final Report, Oct 1973 - Oct 1974

James F Needham Jan 1975 96 p refs
 (Contract DAAJ02-74-C-0005 DA Proj 1F1-62808-A-170)
 (AD-A006131 HH-74-141, USAAMRDL-TR-74-101) Avail NTIS CSCL 01/3

The purpose of this study was to develop rational failsafe/safe-life interface criteria for the design of helicopter structural

components. Present specifications containing design criteria were reviewed and deficient areas defined. Rational design criteria were developed and are titled Damage-Tolerant Design Criteria. Damage-tolerant design concepts are presented for various helicopter structural components. They include redundant structure, controlled fracture structure and failure indicating systems. The Hughes OH-6A main rotor blade was selected as the structural component to establish the effects on life-cycle costs in designing to different structural criteria and using different damage-tolerant design concepts. THE EFFECT OF MEAN STRESS ON THE FATIGUE OF ALUMINUM ALLOYS

J Gott London Min of Defence 1974 107 p refs
 (Contract MIN-DEF/PE-AT/2161/01/STR)
 (S/T-Memo-9/74 BR34131) Avail NTIS HC \$5 25

Fatigue tests were performed on notched specimens of three precipitation hardened aluminum alloys under constant amplitude loading. The fatigue characteristics were obtained over a range of mean stress values which include tensile and compressive levels, comparisons were made between the three alloys and between the two notch factors used in the tests. Correlation was obtained between alternating stress and the numbers of fatigue nuclei and evidence of two types of fatigue failure at certain stress levels is identified. A useful method of presenting data at different mean stress values is introduced. Author (ESRO)

A SHORT STUDY OF THE EFFECT OF A PENETRANT OIL ON THE FATIGUE LIFE OF A RIVETED JOINT

P H O'Neill and R J Smith London Aeron Res Council 1975 12 p Supersedes RAE-TR-73174 ARC-35284
 (ARC-CP-1305 RAE-TR-73174, ARC-35284) Avail NTIS HC \$3 25 HMSO 32P PHI \$1 45

Laboratory fatigue tests on riveted joints, half of which had been impregnated with a water-displacing oil-based penetrant which is commonly being used in airline service to combat corrosion are described. The results showed that the lives of the treated specimens were significantly shorter than those of the untreated specimens. Further work, however, would be necessary to determine the effect of the penetrant under more realistic conditions over a longer time. Author (ESRO)

USAF AIRCRAFT POLLUTION EMISSION FACTORS AND LANDING AND TAKEOFF LTO CYCLES Final Report, 1 Jun - 1 Nov 1974

Dennis F Naugle and Steven R Nelson Feb 1975 50 p refs

(AD-A006239 AFWL-TR-74-303) Avail NTIS CSCL 13/2

Analysis of total pollution emissions from USAF aircraft requires basic data such as aircraft engine pollution emission factors and landing and takeoff (LTO) time-in-modes. The report updates the list of measured pollution emission factors specific to each major USAF aircraft engine type. Results of original research to define USAF LTO cycle times for nine operational modes per aircraft type are presented. GRA

**DIGITAL SIMULATION OF V/STOL AIRCRAFT FOR
AUTOPILOT RESEARCH**

L S Cicolani and George Meyer *In its Large-Scale Dyn Systems*
1975 p 163-183 refs

CSCL 12B

Simulations of V/STOL aircraft for autopilot research were introduced as examples of large scale systems. A hierarchy of simulations was assembled and a modular organization was given to the simulations. The dynamics of the system were subdivided into translational and rotational degrees of freedom based on the different frequencies at which significant variations in motion variables control forces and moments occur in two subsystems. This is the basis of the autopilot partitioning into two smaller control problems. Author

SUBJECT INDEX

AERONAUTICAL ENGINEERING /A Special Bibliography (Suppl 63)

NOVEMBER 1975

Typical Subject Index Listing

The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, a title extension is added separated from the title by three hyphens. The NASA or AIAA accession number is included in each entry to assist the user in locating the abstract in the abstract section of this supplement. If applicable, a report number is also included as an aid in identifying the document.

aircraft A75-41798

SUBJECT INDEX

AIRCRAFT TIRES

- A design study for a remotely piloted vehicle, automatic landing system
[AD-A005285] N75-28059
- Analysis of visibility conditions for aircraft landing in radiation fog
[BLL-M-23561-(5828.4F)] N75-28632
- AIRCRAFT MAINTENANCE**
Engine maintenance management program requires information
[SAE PAPER 750613] A75-40520
- AIRCRAFT MANEUVERS**
Pilot information requirements for air combat maneuvering
A75-41410
- Combat Energy Maneuverability Display - CEMD /Flight dynamic and fire control information integration/
A75-41411
- Aircraft optimal weapon delivery maneuvers based on extended energy management --- air-to-air missile launching
[AIAA PAPER 75-1076] A75-41642
- Conflict resolution maneuvers in an Intermittent Positive Control system --- ground based automatic aircraft collision avoidance model
[AIAA PAPER 75-1125] A75-41685
- Extraction from flight data of longitudinal aerodynamic coefficients in maneuvering flight for F-8C aircraft
[NASA-TN-D-8019] N75-29039
- G-load measuring and indicator apparatus
[NASA-CASE-ARC-10806-1] N75-29381
- AIRCRAFT MODELS**
Free-flight model dynamic stability measurements on a not-so-slender wing/fin combination at zero and small lift, Mach number equals 0.8 to 2.0
[ARC-CP-1315] N75-29051
- User's guide for a revised computer program to analyze the LRC 16 foot transonic dynamics tunnel active cable mount system --- computer techniques - aircraft models
[NASA-CR-132692] N75-29130
- Simulation of large-scale dynamic systems
N75-29846
- AIRCRAFT NOISE**
Analysis of the costs, effectiveness, and benefits of aircraft noise reduction programs
[SAE PAPER 750595] A75-40504
- Noise reduction of EBF propulsive-lift systems --- Externally Blown Flaps
[SAE PAPER 750608] A75-40515
- Noise levels in the CC-109, CC-115, and CC-117 aircraft
[DCIEM-74-R-1059] N75-28065
- Interior noise levels of two propeller-driven light aircraft
[NASA-TM-X-72716] N75-28066
- Trends in aircraft noise control
N75-29008
- Annoyance resulting from intrusion of aircraft sounds upon various activities
[NGR-43-008-008] N75-29112
- A computer program for helicopter rotor noise using Lowson's formula in the time domain
[NASA-TM-X-72759] N75-29116
- AIRCRAFT PARTS**
The impact between a liquid drop and an elastic half-space
[PB-241155/1] N75-29378
- AIRCRAFT PERFORMANCE**
Performance compatibility and flight testing of B-52 CCV systems
[AIAA PAPER 75-1035] A75-39528
- The use of autocorrelation functions to predict the effects of vertical deflections on aircraft navigation
[AIAA PAPER 75-1101] A75-41663
- AIRCRAFT PRODUCTION**
Test results on computer graphics productivity for aircraft design and fabrication
[AIAA PAPER 75-967] A75-39493
- AIRCRAFT RELIABILITY**
Disc failures - A cause for concern
A75-40532
- Army preliminary evaluation 1: RV-1D/quick look 2 aircraft
[AD-A005220] N75-28058
- AIRCRAFT SAFETY**
Air safety as seen from the tower
A75-41702
- Flight safety work of the German Aviation and Space Research Institute
[DLR-MIT-75-05] N75-29070
- AIRCRAFT STABILITY**
Influence of rigidity and damping in an elevator control system on the longitudinal stability of an aircraft and on elevator vibrations
A75-39340
- Ride-quality testing under controlled flight conditions
[AIAA PAPER 75-987] A75-39502
- The C-5A active load alleviation system
[AIAA PAPER 75-991] A75-39504
- Flutter investigations on a combat aircraft with a command and stability augmentation system
[AIAA PAPER 75-1025] A75-39520
- P-15 flight flutter testing - Aircraft systems and test operations
[AIAA PAPER 75-1031] A75-39526
- Use of short period frequency requirements in horizontal tail sizing
A75-40550
- Use of fly-by-wire to obtain performance improvements in a delta-canard design
[AIAA PAPER 75-1061] A75-41631
- Theoretical prediction of airplane stability derivatives at subcritical speeds
[NASA-CR-132681] N75-29089
- A direct time history study of the response of an airplane to nonstationary turbulence
[AD-A006159] N75-29102
- A throat-bypass stability system for a YF-12 aircraft research inlet using self-acting mechanical valves
[NASA-TM-X-71779] N75-29128
- AIRCRAFT STRUCTURES**
Fiber composite structures --- review
A75-38901
- Impact of a flight vehicle on a spherical shell --- German book
A75-39223
- Vibration tests of a structure with dry friction
A75-39330
- Aerospace sandwich materials
A75-39351
- Structure interpretation by consideration of vibration resistance in light construction
A75-39402
- Northrop/United States Air Force F-5E Aircraft Fatigue Structural Integrity Program
[AIAA PAPER 75-988] A75-39503
- Composites technology - Threshold to low cost aircraft structures
[AIAA PAPER 75-1006] A75-39509
- Theory for calculating a wing of small aspect ratio from a discrete-continuous calculation scheme /matrix differential equation of axial displacements/
A75-40905
- Weldbonding of aluminum aircraft structures
A75-40985
- Preproduction evaluation of an improved titanium surface prebonding process
A75-40992
- PABST - A technology demonstrator --- Primary Adhesively Bonded Structure for aircraft
[AIAA PAPER 75-989] A75-41690
- Shear and moment response of the airplane wing to nonstationary turbulence
[NAL-TR-404T] N75-29032
- Recent NASA progress in composites --- application to spacecraft and aircraft structures
[NASA-TM-X-72713] N75-29188
- AIRCRAFT SURVIVABILITY**
Proposed MIL-STD-XXX aircraft nonnuclear survivability/vulnerability terms
[AD-A004972] N75-28056
- AIRCRAFT TIRES**
Operational reliability of aircraft wheels --- Russian book
A75-40174

AIRCRAFT WAKES

- Laser Doppler velocimeter system simulation for sensing aircraft wake vortices. Part 2: Processing and analysis of LDV data (for runs 1023 and 2023)
[NASA-CR-120759] N75-28394
- Laser Doppler velocimeter system simulation for sensing aircraft wake vortices. Part 3: The problem of reflection from the secondary mirror
[NASA-CR-120759] N75-28395
- On wake vortex alleviation N75-29010

AIRFOIL PROFILES

- The role of the NAE 5x5 foot wind tunnel in the development of modern airfoil sections A75-39022
- The effect of the surface roughness of blade profiles on the flow characteristics of a turbine --- German book A75-39220
- A theory for the calculation of conical paragliders with weak camber in supersonic flow --- German book A75-39224
- The experimental cascade performance of NACA compressor profiles at low Reynolds number A75-39350
- Divergence elimination with advanced composites --- for swept forward airfoils [AIAA PAPER 75-1009] A75-39511
- The problem of the optimal form of lifting bodies in Newtonian flow A75-40260
- Advanced high lift design through analytical/experimental techniques [AIAA PAPER 75-992] A75-41692
- Theoretical effect of modifications to the upper surface of two NACA airfoils using smooth polynomial additional thickness distributions which emphasize leading edge profile and which vary linearly at the trailing edge [NASA-CR-137717] N75-29030

AIRFOILS

- Theoretical and experimental study of a new method for prediction of profile drag of airfoil sections [NASA-CR-2539] N75-28003
- Procedures for the design of low-pitching-moment airfoils [NASA-TN-D-7982] N75-28004
- Effects of Reynolds number and roughness on C sub Lmax --- aerodynamic characteristics of airfoil [NAL-TR-396] N75-29026
- Transonic data memorandum: Second-order method for estimating the subcritical pressure distribution on a two-dimensional aerofoil in compressible inviscid flow [ESDU-72025] N75-29029
- Higher order wind tunnel corrections for a two-dimensional circular arc lifting aerofoil in a closed rectangular wind tunnel [ARL/A-NOTW-349] N75-29034
- Experimental and theoretical investigations on the problem of propeller/wing interference up to high angles of attack [NASA-TR-P-16490] N75-29035
- Wind tunnel generation of sinusoidal lateral and longitudinal gusts by circulation of twin parallel airfoils [NASA-CR-137547] N75-29351

AIRFRAME MATERIALS

- Northrop/United States Air Force P-5E Aircraft Fatigue Structural Integrity Program [AIAA PAPER 75-988] A75-39503
- Composites technology - Threshold to low cost aircraft structures [AIAA PAPER 75-1006] A75-39509
- PABST - A technology demonstrator --- Primary Adhesively Bonded Structure for aircraft [AIAA PAPER 75-989] A75-41690

AIRFRAMES

- Weapon system costing methodology for aircraft airframes and basic structures. Volume 2: Supporting design synthesis programs [AD-A005426] N75-28051
- Analytical investigation of medium STOL transport structural concepts. Volume 1: Study results [AD-A005818] N75-28060

- Shear and tension-bending fatigue test methods for threaded airframe fasteners [COM-75-10417/4] N75-28444
- Technical evaluation report on fluid dynamics panel symposium on Airframe/Propulsion --- a discussion of air intakes, nozzle flow, and flow distribution [AGARD-AR-81] N75-29114
- AIRLINE OPERATIONS**
- Airtransit's first six months of operating the Canadian STOL demonstration service [SAE PAPER 750599] A75-40508
- Whither all weather - An airline engineer's point of view --- landing system design [SAE PAPER 750600] A75-40509
- Maximum installed engine utilization through disciplined health monitoring --- of commercial aircraft engine systems [SAE PAPER 750612] A75-40519
- Fuel conservation possibilities for terminal area compatible transport aircraft [AIAA PAPER 75-1036] A75-41698
- The next forty years in aviation N75-29007

AIRPLANE PRODUCTION COSTS

- Composites technology - Threshold to low cost aircraft structures [AIAA PAPER 75-1006] A75-39509

AIRPORTS

- Flight experience with time-of-arrival control for STOL aircraft in the terminal area [AIAA PAPER 75-1126] A75-41686

AIRSHIPS

- The airship debate --- revival feasibility A75-39321
- Is there an airship in your future A75-39923
- Future lighter-than-air concepts [SAE PAPER 750618] A75-40523

ALGORITHMS

- Optimum flight profiles for short haul missions [AIAA PAPER 75-1124] A75-41684
- Intermittent positive control computer algorithm for test bed experiments --- collision avoidance - aircraft guidance [AD-A009215] N75-29068

ALL-WEATHER LANDING SYSTEMS

- Whither all weather - An airline engineer's point of view --- landing system design [SAE PAPER 750600] A75-40509
- Whither all weather - An airplane manufacturer's point of view --- all weather landing systems [SAE PAPER 750601] A75-40510
- Automatic all-weather landing control [AIAA PAPER 75-1021] A75-41699

ALUMINUM

- Weldbonding of aluminum aircraft structures A75-40985

ALUMINUM ALLOYS

- Characterization of 8-mil boron/aluminum material --- tensile, shear and fatigue tests A75-40963
- The effect of mean stress on the fatigue of aluminum alloys --- notched specimens [S/T-MEMO-9/74] N75-29482

ANGLE OF ATTACK

- Estimation of transonic aircraft aerodynamics to high angles of attack [AIAA PAPER 75-996] A75-39508
- The jet flap wing in proximity to the ground, giving particular attention to large angles of attack and large jet-flap angles --- German book A75-41233
- Longitudinal motions of aircraft involving high angles of attack [ARC-R/M-3753] N75-29094
- Measurements at the leeward side of a cone at large incidences in supersonic flow [VTH-186] N75-29370

ANTENNA DESIGN

- Review of presently employed narrow-beam microwave antennas. II A75-39268

ANTENNA RADIATION PATTERNS

- Review of presently employed narrow-beam microwave antennas. II A75-39268

SUBJECT INDEX

BLOWING

An analysis of aircraft L-band beacon antenna patterns
[AD-A005569] N75-29287

APPROACH CONTROL
Application of steep angle approach in an engineering and flight test program
[AD-A005074] N75-28053

AREA NAVIGATION
Flight experience with time-of-arrival control for STOL aircraft in the terminal area
[AIAA PAPER 75-1126] A75-41686

ARROW WINGS
Design study of structural concepts for an arrow-wing supersonic-cruise aircraft
[AIAA PAPER 75-1037] A75-39529
Application of an advanced computerized structural design system to an arrow-wing supersonic cruise aircraft
[AIAA PAPER 75-1038] A75-39530
Advanced supersonic transport
[SAE PAPER 750617] A75-40522

ATLAS LAUNCH VEHICLES
Some production experiences with composite structures --- graphite/epoxy components for Atlas missiles
A75-41000

ATMOSPHERIC TURBULENCE
Application of active control technology to aircraft ride smoothing
[AIAA PAPER 75-1029] A75-39524
On the response of an airplane to sinusoidal gust
A75-41474
Shear and moment response of the airplane wing to nonstationary turbulence
[NAL-TR-404T] N75-29032

ATTACK AIRCRAFT
Extension of the method for predicting six-degree-of-freedom store separation trajectories at speeds up to the critical speed to include a fuselage with noncircular cross section. Volume 1: Theoretical methods and comparisons with experiment --- external stores - attack aircraft
[AD-A005822] N75-29071

AUDITORY DEFECTS
Noise levels in the CC-109, CC-115, and CC-117 aircraft
[DCIEM-74-R-1059] N75-28065

AUSTENITIC STAINLESS STEELS
Development and evaluation of high-energy brake materials
N75-28139

AUTOCORRELATION
The use of autocorrelation functions to predict the effects of vertical deflections on aircraft navigation
[AIAA PAPER 75-1101] A75-41663

AUTOMATIC CONTROL
Miniaturized high speed controls for turbine engines fabrication and test
[AD-A006108] N75-29125

AUTOMATIC FLIGHT CONTROL
Ride-quality testing under controlled flight conditions
[AIAA PAPER 75-987] A75-39502
Flutter investigations on a combat aircraft with a command and stability augmentation system
[AIAA PAPER 75-1025] A75-39520
YC-14 flight control
[AIAA PAPER 75-1027] A75-39522
The BSU-ZP onboard control system --- Russian book on computer aided aircraft control, navigation and landing systems
A75-40175
Y-16 - First with fly-by-wire
A75-40475
A contribution to the design of digital self-adaptive flight control systems --- German book
A75-41598
FCAP - A new tool for the evaluation of active control technology --- Flight Control Analysis Program for flexible aircraft
[AIAA PAPER 75-1059] A75-41630
Development of automatic terrain-following/automatic terrain-avoidance decoupling techniques
[AIAA PAPER 75-1074] A75-41640

Integrated flight/propulsion control by state regulation
[AIAA PAPER 75-1075] A75-41641
Effects of sampling rate and transformation techniques on the design of digital notch filters --- for aircraft flight control systems design
[AIAA PAPER 75-1084] A75-41649
Digital multimode flight control system
[AIAA PAPER 75-1085] A75-41650
Balanced functional design of automatic digital flight control systems
[AIAA PAPER 75-1088] A75-41653
On the design of a model reference adaptive flight control system
[AIAA PAPER 75-1111] A75-41673
Automatic control of drones and RPV's in formation
[AIAA PAPER 75-1122] A75-41683
Conflict resolution maneuvers in an Intermittent Positive Control system --- ground based automatic aircraft collision avoidance model
[AIAA PAPER 75-1125] A75-41685
Airborne electronics for automated flight systems
N75-29011
Status and trends in active control technology
N75-29015

AUTOMATIC LANDING CONTROL

The BSU-ZP onboard control system --- Russian book on computer aided aircraft control, navigation and landing systems
A75-40175
Wind modeling and lateral control for automatic landing
[AIAA PAPER 75-1077] A75-41643
Automatic all-weather landing control
[AIAA PAPER 75-1021] A75-41699

AUTOMATIC PILOTS

The BSU-ZP onboard control system --- Russian book on computer aided aircraft control, navigation and landing systems
A75-40175
Optimal design of a Mini-RPV lateral autopilot
[AIAA PAPER 75-1121] A75-41682
Digital simulation of V/STOL aircraft for autopilot research
N75-29853

AUXILIARY POWER SOURCES

Small gas turbine auxiliary power units
[ASME PAPER 75-ENAS-1] A75-40896

AVIONICS

Flight experience with time-of-arrival control for STOL aircraft in the terminal area
[AIAA PAPER 75-1126] A75-41686

AZIMUTH

Design of an improved azimuth reference system
[AIAA PAPER 75-1083] A75-41648

B**B-1 AIRCRAFT**

Propulsion system configuration development for the B-1 strategic bomber
[AIAA PAPER 75-1040] A75-39532
The B-1 environmental control system
[ASME PAPER 75-ENAS-13] A75-40891

B-52 AIRCRAFT

Performance compatibility and flight testing of B-52 CCV systems
[AIAA PAPER 75-1035] A75-39528

BASE FLOW

Numerical investigation of the flow of a viscous, heat-conducting gas past a blunt body with finite dimensions
A75-40255

BENDING MOMENTS

Effects of wing bend on the aerodynamic characteristics of a low aspect ratio oblique wing
[AIAA PAPER 75-995] A75-39507

BIPLANES

Remarks on approximate conformal representation of biplane wing sections
A75-40405

BLOWDOWN WIND TUNNELS

The role of the NAE 5x5 foot wind tunnel in the development of modern airfoil sections
A75-39022

BLOWING

A large-scale low-speed tunnel test of a canard configuration with spanwise blowing
[AIAA PAPER 75-994] A75-39506

BLUNT BODIES

SUBJECT INDEX

BLUNT BODIES

Numerical investigation of the flow of a viscous, heat-conducting gas past a blunt body with finite dimensions A75-40255

The problem of the optimal form of lifting bodies in Newtonian flow A75-40260

Solution of the inverse problem of the hypersonic gas flow past a slender blunted body A75-40912

Numerical computation of three-dimensional blunt body flow fields with an impinging shock [NASA-CR-143312] N75-29038

BODY-WING AND TAIL CONFIGURATIONS

Advanced supersonic transport [SAE PAPER 750617] A75-40522

Measurement and analysis of unsteady aerodynamic force for the vertical gust on an airplane model in the NAL gust wind tunnel --- swept wing interference tests [NAL-TR-399] N75-29027

BODY-WING CONFIGURATIONS

Effects of wing bend on the aerodynamic characteristics of a low aspect ratio oblique wing [AIAA PAPER 75-995] A75-39507

Joint USAF/NASA hypersonic research aircraft study [AIAA PAPER 75-1039] A75-39531

Transonic wind tunnel investigation of thrust effects on the longitudinal stability characteristics of several body-fin configurations (sting-mounted model with normal-jet plume simulator) [AD-A005152] N75-28042

BOEING 727 AIRCRAFT

Wind tunnel test of model target thrust reversers for the Pratt and Whitney aircraft JT8D-100 series engines installed on a 727-200 airplane [NASA-CR-134709] N75-29117

BOEING 747 AIRCRAFT

747 air carriage of the Space Shuttle Orbiter A75-40602

BOMBER AIRCRAFT

Development of automatic terrain-following/automatic terrain-avoidance decoupling techniques [AIAA PAPER 75-1074] A75-41640

BORON REINFORCED MATERIALS

Characterization of 8-mil boron/aluminum material --- tensile, shear and fatigue tests A75-40963

BOUNDARY LAYER CONTROL

Opportunities for aerodynamic-drag reduction N75-29016

BOUNDARY LAYER FLOW

Measurements in an incompressible three-dimensional turbulent boundary layer, under infinite swept-wing conditions, and comparison with theory A75-40206

C

C-5 AIRCRAFT

C-5A air launch of Minuteman I missile [AIAA PAPER 75-969] A75-39494

The C-5A active load alleviation system [AIAA PAPER 75-991] A75-39504

CABIN ATMOSPHERES

A fluidically controlled aircraft environmental system [ASME PAPER 75-ENAS-7] A75-40894

CABLES (ROPES)

User's guide for a revised computer program to analyze the LRC 16 foot transonic dynamics tunnel active cable mount system --- computer techniques - aircraft models [NASA-CR-132692] N75-29130

CAMBERED WINGS

Pressure distributions on a cambered wing body configuration at subsonic Mach numbers [NASA-TN-D-7946] N75-28029

CANARD CONFIGURATIONS

A large-scale low-speed tunnel test of a canard configuration with spanwise blowing [AIAA PAPER 75-994] A75-39506

Use of fly-by-wire to obtain performance improvements in a delta-canard design [AIAA PAPER 75-1061] A75-41631

Effect of vertical-tail location on the aerodynamic characteristics at subsonic speeds of a close-coupled canard configuration [NASA-TN-D-7947] N75-28027

CARBON FIBER REINFORCED PLASTICS

Processable high temperature resistant polymer matrix materials A75-39482

Integrally stiffened graphite/epoxy construction --- for wingboxes A75-40960

Low-flow, low pressure curing resins --- for graphite fiber/epoxy composites A75-40973

PMR polyimides - Processable high temperature composite matrix resins A75-40999

Some production experiences with composite structures --- graphite/epoxy components for Atlas missiles A75-41000

Cooperative program for design, fabrication, and testing of graphite-epoxy composite helicopter shafting [AD-A005024] N75-28244

CARGO

The convention on international combined transport of goods - A new start also with regard to air transport A75-40200

CARGO AIRCRAFT

The challenge to advanced cargo aircraft systems A75-39019

CASCADE FLOW

The experimental cascade performance of NACA compressor profiles at low Reynolds number A75-39350

CELLULOSE

Static fatigue behavior of cellulose and polyamide materials --- helicopter external load slings A75-40967

CIVIL AVIATION

Civil aviation midair collisions analysis: 1972 added to 1964 - 1971 results --- statistical analysis [AD-A005897] N75-29064

COAXIAL FLOW

Thrust/drag analysis for a front fan nacelle having two separate co-axial exhaust streams --- for turbofan engines [ARC-CP-1311] N75-29049

COLLISION AVOIDANCE

Conflict resolution maneuvers in an Intermittent Positive Control system --- ground based automatic aircraft collision avoidance model [AIAA PAPER 75-1125] A75-41685

Air safety as seen from the tower A75-41702

Intermittent positive control computer algorithm for test bed experiments --- collision avoidance - aircraft guidance [AD-A009215] N75-29068

COMBAT

Pilot information requirements for air combat maneuvering A75-41410

Combat Energy Maneuverability Display - CEMD /Flight dynamic and fire control information integration/ A75-41411

COMBINATORIAL ANALYSIS

F-89 hydraulic actuator combinatorial geometric representation [AD-A006435] N75-29101

COMBUSTION CHAMBERS

Pollution control in continuous combustion engines A75-40833

COMBUSTION PRODUCTS

Assessing and controlling the effect of aircraft on the environment: Pollution N75-29009

COMMAND AND CONTROL

Flutter investigations on a combat aircraft with a command and stability augmentation system [AIAA PAPER 75-1025] A75-39520

Lateral-directional stability augmentation methods for the STOL flight regime [AIAA PAPER 75-1028] A75-39523

SUBJECT INDEX

CONFORMAL MAPPING

COMMAND GUIDANCE

Automatic control of drones and RPV's in formation
[AIAA PAPER 75-1122] A75-41683

COMMERCIAL AIRCRAFT

Parallelism in commercial and military use of simulation
[AIAA PAPER 75-971] A75-39496
Jet aircraft emissions during cruise - Present and future
[AIAA PAPER 75-1018] A75-39516
Maximum installed engine utilization through disciplined health monitoring --- of commercial aircraft engine systems
[SAE PAPER 750612] A75-40519
Future hydrogen fueled commercial transports
[SAE PAPER 750615] A75-40521
Operational experiences of a commercial helicopter flown in a large metropolitan area
[NASA-TN-D-8000] N75-28045

COMPONENT RELIABILITY

Operational reliability of aircraft wheels --- Russian book
A75-40174

COMPOSITE MATERIALS

Processable high temperature resistant polymer matrix materials
A75-39482
Divergence elimination with advanced composites --- wing planforms - aircraft design
N75-28137
Air Force technical objective document, Fiscal year 1975 --- composite materials, heat resistant alloys, thermal insulation, protective coatings
[AD-A005386] N75-28961
Some trends in aircraft design: Structures
N75-29014
Recent NASA progress in composites --- application to spacecraft and aircraft structures
[NASA-TM-X-72713] N75-29188

COMPOSITE STRUCTURES

Fiber composite structures --- review
A75-38901
Composites technology - Threshold to low cost aircraft structures
[AIAA PAPER 75-1006] A75-39509
Divergence elimination with advanced composites --- for swept forward airfoils
[AIAA PAPER 75-1009] A75-39511
Kerimid 353 bis-maleimide laminating resin
A75-40972
Low-flow, low pressure curing resins --- for graphite fiber/epoxy composites
A75-40973
PMR polyimides - Processable high temperature composite matrix resins
A75-40999
Some production experiences with composite structures --- graphite/epoxy components for Atlas missiles
A75-41000
The results of fabrication and testing of the prototype composite rotor blades for HLR and UTTAS --- Heavy Lift Helicopter and Utility Tactical Transport Aircraft System
[AIAA PAPER 75-1010] A75-41694
Conceptual design study of advanced acoustic-composite nacelles
[NASA-CR-132703] N75-29093

COMPRESSIBLE FLOW

Transonic data memorandum: Second-order method for estimating the subcritical pressure distribution on a two-dimensional aerofoil in compressible inviscid flow
[ESDU-72025] N75-29029
The prediction of boundary-layer behaviour and profile drag for infinite waned wings. Part 1: A method of calculation
[ARC-CP-1307-PT-1] N75-29046

COMPRESSOR BLADES

The experimental cascade performance of NACA compressor profiles at low Reynolds number
A75-39350

COMPUTER GRAPHICS

The concept of an interactive graphic design system /IGDS/ with distributed computing
[AIAA PAPER 75-966] A75-39492

Test results on computer graphics productivity for aircraft design and fabrication
[AIAA PAPER 75-967] A75-39493

COMPUTER PROGRAMS

Weapon system costing methodology for aircraft airframes and basic structures. Volume 2: Supporting design synthesis programs
[AD-A005426] N75-28051
Acoustic radiation from lined, unflanged ducts: Acoustic source distribution program
[NASA-CR-120849] N75-28849
Acoustic radiation from lined unflanged ducts: Directivity index program
[NASA-CR-120850] N75-28850
Acoustic radiation from lined, unflanged ducts: Duct termination impedance program
[NASA-CR-120851] N75-28851
A technique for analysing the results of a flutter calculation --- exemplified for tail assembly with two degrees of freedom
[NASA-R/M-3765] N75-29054
Intermittent positive control computer algorithm for test bed experiments --- collision avoidance - aircraft guidance
[AD-A009215] N75-29068
F-89 hydraulic actuator combinatorial geometric representation
[AD-A006435] N75-29101
A computer program for helicopter rotor noise using Lowson's formula in the time domain
[NASA-TM-X-72759] N75-29116
An improved numerical procedure for the parametric optimization of three dimensional scramjet nozzles --- supersonic combustion ramjet engines - computer programs
[NASA-CR-132695] N75-29359

COMPUTER TECHNIQUES

Engine maintenance management program requires information
[SAE PAPER 750613] A75-40520
Air safety as seen from the tower
A75-41702

User's guide for a revised computer program to analyze the LRC 16 foot transonic dynamics tunnel active cable mount system --- computer techniques - aircraft models
[NASA-CR-132692] N75-29130

COMPUTERIZED DESIGN

The concept of an interactive graphic design system /IGDS/ with distributed computing
[AIAA PAPER 75-966] A75-39492
Test results on computer graphics productivity for aircraft design and fabrication
[AIAA PAPER 75-967] A75-39493
Estimation of transonic aircraft aerodynamics to high angles of attack
[AIAA PAPER 75-996] A75-39508
Application of an advanced computerized structural design system to an arrow-wing supersonic cruise aircraft
[AIAA PAPER 75-1038] A75-39530
Digital flight control for advanced fighter aircraft
[AIAA PAPER 75-1086] A75-41651

COMPUTERIZED SIMULATION

PCAP - A new tool for the evaluation of active control technology --- Flight Control Analysis Program for flexible aircraft
[AIAA PAPER 75-1059] A75-41630
Automatic control of drones and RPV's in formation
[AIAA PAPER 75-1122] A75-41683
A GASP 4 simulation of tactical air interdiction using a choice of weapons loads and continuously changing weather conditions
[AD-A006349] N75-29417

CONFERENCES

Anglo-American Aeronautical Conference, 14th, Los Angeles, Calif., August 4-7, 1975, Technical Papers
A75-39017
Specialists Meeting on Wing-with-Stores Flutter
[AGARD-CP-162] N75-28011
NASA/University Conference on Aeronautics
[NASA-SP-372] N75-29001

CONFORMAL MAPPING

Remarks on approximate conformal representation of biplane wing sections
A75-40405

CONICAL CAMBER

SUBJECT INDEX

CONICAL CAMBER

- A theory for the calculation of conical
paragliders with weak camber in supersonic flow
--- German book A75-39224

CONICAL FLOW

- Measurements at the leeward side of a cone at
large incidences in supersonic flow
[VTH-186] N75-29370

CONSTRUCTION MATERIALS

- Thermostructural and material considerations in
the design of the F-14 aircraft transparencies
[AIAA PAPER 75-990] A75-41691
- Some trends in aircraft design: Structures N75-29014

CONTROL CONFIGURED VEHICLES

- Performance compatibility and flight testing of
B-52 CCV systems
[AIAA PAPER 75-1035] A75-39528
- Integrated flight/propulsion control by state
regulation
[AIAA PAPER 75-1075] A75-41641

CONTROL SIMULATION

- PCAP - A new tool for the evaluation of active
control technology --- Flight Control Analysis
Program for flexible aircraft
[AIAA PAPER 75-1059] A75-41630
- On the design of a model reference adaptive flight
control system
[AIAA PAPER 75-1111] A75-41673

CONTROL STABILITY

- Determination of aerodynamic coupling derivatives
through flight test
[AIAA PAPER 75-1119] A75-41680

COST ANALYSIS

- Analysis of the costs, effectiveness, and benefits
of aircraft noise reduction programs
[SAE PAPER 750595] A75-40504
- Optimization of the time between aircraft
overhauls by minimizing maintenance cost
[AD-A006505] N75-29100

COST EFFECTIVENESS

- Design of short haul aircraft for fuel conservation
[SAE PAPER 750587] A75-40502

COST ESTIMATES

- Weapon system costing methodology for aircraft
airframes and basic structures. Volume 2:
Supporting design synthesis programs
[AD-A005426] N75-28051

CRASH LANDING

- Crashworthy helicopter gunner's seat investigation
[AD-A005563] N75-28054

CRUISING FLIGHT

- Analysis of response requirements for V/STOL
lift/cruise engines used to provide height and
moment control
[AIAA PAPER 75-1014] A75-39514
- Jet aircraft emissions during cruise - Present and
future
[AIAA PAPER 75-1018] A75-39516
- Design study of structural concepts for an
arrow-wing supersonic-cruise aircraft
[AIAA PAPER 75-1037] A75-39529
- Application of an advanced computerized structural
design system to an arrow-wing supersonic cruise
aircraft
[AIAA PAPER 75-1038] A75-39530
- The NASA research program on propulsion for
supersonic cruise aircraft
[SAE PAPER 750629] A75-40531

D

DATA LINKS

- DABS link performance considerations
[AD-A009429] N75-29078
- Data link short-message cockpit display test
[AD-A005988] N75-29285

DATA MANAGEMENT

- YC-14 digital flight control data management
[AIAA PAPER 75-1087] A75-41652

DATA PROCESSING

- Laser Doppler velocimeter system simulation for
sensing aircraft wake vortices. Part 2:
Processing and analysis of LDV data (for runs
1023 and 2023)
[NASA-CR-120758] N75-28394

DATA SAMPLING

- Effects of sampling rate and transformation
techniques on the design of digital notch filters
--- for aircraft flight control systems design
[AIAA PAPER 75-1084] A75-41649

DC 8 AIRCRAFT

- Wind modeling and lateral control for automatic
landing
[AIAA PAPER 75-1077] A75-41643

- Engineering simulation evaluation of the
two-segment noise abatement approach in the
Douglas DC-8-61
[NASA-CR-137665] N75-29121

DC 9 AIRCRAFT

- DC-9 flight testing of the refanned JT8D engine
[AIAA PAPER 75-998] A75-41693

DEGREES OF FREEDOM

- Extension of the method for predicting
six-degree-of-freedom store separation
trajectories at speeds up to the critical speed
to include a fuselage with noncircular cross
section. Volume 1: Theoretical methods and
comparisons with experiment --- external stores
- attack aircraft
[AD-A005822] N75-29071

DELTA WINGS

- Calculation of supersonic inviscid flow about a
pyramidal-body model of a delta-shaped vehicle
A75-40254

- Use of fly-by-wire to obtain performance
improvements in a delta-canard design
[AIAA PAPER 75-1061] A75-41631

DESCENT TRAJECTORIES

- Time-controlled descent guidance in uncertain winds
[AIAA PAPER 75-1078] A75-41644

DESERTS

- Desert storage test program
[AD-A006103] N75-29454

DESIGN ANALYSIS

- Simultaneous calculation of aircraft design loads
and structural member sizes
[AIAA PAPER 75-965] A75-39491
- Advanced supersonic transport
[SAE PAPER 750617] A75-40522
- Analytical design of a monolithic wing
A75-40903

- A contribution to the design of digital
self-adaptive flight control systems --- German
book A75-41598

- Optimal design of a Mini-RPV lateral autopilot
[AIAA PAPER 75-1121] A75-41682

- Advanced high lift design through
analytical/experimental techniques
[AIAA PAPER 75-992] A75-41692

- Preliminary design study of a quiet, high flow fan
(QHF) stage --- turbofans - quiet engine program
[NASA-CR-134780] N75-29433

DICTIONARIES

- Proposed MIL-STD-XXX aircraft nonnuclear
survivability/vulnerability terms
[AD-A004972] N75-28056

DIFFERENTIAL EQUATIONS

- Differential thrust equations for a transient mode
of engine operation
A75-40922

DIFFERENTIAL GEOMETRY

- Application of differential game theory to
role-determination in aerial combat
[NASA-CR-137713] N75-28822

DIGITAL COMPUTERS

- Digital fuel controller for lift jet engine
[NAL-TR-389] N75-29122

- Digital flight control system redundancy study ---
fly by wire control - aircraft guidance
[AD-A006411] N75-29129

DIGITAL FILTERS

- Effects of sampling rate and transformation
techniques on the design of digital notch filters
--- for aircraft flight control systems design
[AIAA PAPER 75-1084] A75-41649

DIGITAL NAVIGATION

- The BSU-2P onboard control system --- Russian book
on computer aided aircraft control, navigation
and landing systems
A75-40175

- YC-14 digital flight control data management
[AIAA PAPER 75-1087] A75-41652

Automatic control of drones and RPV's in formation
[AIAA PAPER 75-1122] A75-41683

DIGITAL SIMULATION
Numerical simulation of turbulent jet noise, part 1
[NASA-CR-132693] N75-28069
Digital simulation of V/STOL aircraft for
autopilot research N75-29853

DIGITAL SYSTEMS
A contribution to the design of digital
self-adaptive flight control systems --- German
book A75-41598
Digital multimode flight control system
[AIAA PAPER 75-1085] A75-41650
Digital flight control for advanced fighter aircraft
[AIAA PAPER 75-1086] A75-41651
Balanced functional design of automatic digital
flight control systems
[AIAA PAPER 75-1088] A75-41653
Data link short-message cockpit display test
[AD-A005988] N75-29285

DIGITAL TECHNIQUES
Aircraft engine speed and fuel flow signal
conditioner with digital output
[ARL/ME-NOTE-354] N75-29111

DIHEDRAL ANGLE
The effect of wing dihedral and section suction
distribution on vortex bursting
[NASA-TM-X-72745] N75-29091

DIRECTIONAL STABILITY
Lateral-directional stability augmentation methods
for the STOL flight regime
[AIAA PAPER 75-1028] A75-39523

DISPLAY DEVICES
COMED - A combined display including a full
electronic facility and a topographical moving
map display --- Combined Map and Electronic
Display for fighter aircraft A75-41404
Holographic horizontal display system A75-41405
Vertical Display/Master Monitor Display A75-41408
Pilot information requirements for air combat
maneuvering A75-41410
Combat Energy Maneuverability Display - CEMD
/Flight dynamic and fire control information
integration/ A75-41411
The use of in-flight simulation to develop control
system and display requirements for conventional
and V/STOL airplanes A75-41415
Feasibility study for a dual field of view-single
detector array infrared system
[AD-A005658] N75-28875
Results of an aircraft visibility questionnaire
concerned with the estimated benefits of
airborne proximity warning indicator systems
[AD-A009884] N75-29061
Data link short-message cockpit display test
[AD-A005988] N75-29285

DIVERGENCE
Divergence elimination with advanced composites
--- for swept forward airfoils
[AIAA PAPER 75-1009] A75-39511
Divergence elimination with advanced composites
--- wing planforms - aircraft design N75-28137

DOPPLER NAVIGATION
The choice of the MLS technique in the United States
A75-39324

DOPPLER RADAR
Laser Doppler velocimeter system simulation for
sensing aircraft wake vortices. Part 2:
Processing and analysis of LDV data (for runs
1023 and 2023)
[NASA-CR-120758] N75-28394
Laser Doppler velocimeter system simulation for
sensing aircraft wake vortices. Part 3: The
problem of reflection from the secondary mirror
[NASA-CR-120759] N75-28395

DOWNWASH
Downwash during supersonic flow about a plate
A75-39857

DRAG MEASUREMENT
Techniques for determining propulsion system
forces for accurate high speed vehicle drag
measurements in flight
[AIAA PAPER 75-964] A75-41689

DRAG REDUCTION
Opportunities for aerodynamic-drag reduction
N75-29016

DROPS (LIQUIDS)
The impact between a liquid drop and an elastic
half-space
[PB-241155/1] N75-29378

DRY FRICTION
Vibration tests of a structure with dry friction
A75-39330

DUCTED FANS
Fan-in-fuselage advanced antitorque system
[AD-A005049] N75-28055
Acoustic radiation from lined, unflanged ducts:
Acoustic source distribution program
[NASA-CR-120849] N75-28849
Acoustic radiation from lined unflanged ducts:
Directivity index program
[NASA-CR-120850] N75-28850
Acoustic radiation from lined, unflanged ducts:
Duct termination impedance program
[NASA-CR-120851] N75-28851

DYNAMIC RESPONSE
Use of short period frequency requirements in
horizontal tail sizing A75-40550
Shear and moment response of the airplane wing to
nonstationary turbulence
[NAL-TR-404T] N75-29032
A direct time history study of the response of an
airplane to nonstationary turbulence
[AD-A006159] N75-29102
A simulation study of active feedback suppression
of dynamic response in helicopter rotor blades
[NASA-CR-132711] N75-29127

E

EARPHONES
Noise levels in the CC-109, CC-115, and CC-117
aircraft
[DCIEM-74-R-1059] N75-28065

ECONOMIC ANALYSIS
Is there an airship in your future A75-39923
Future hydrogen fueled commercial transports
[SAE PAPER 750615] A75-40521

ECONOMIC FACTORS
The challenge to advanced cargo aircraft systems
A75-39019
The long term energy problem and aeronautics
N75-29012

EDGE LOADING
Edge forces and roll-rate derivatives
N75-28033

EDUCATION
Aeronautics in the American Society
N75-29002

ELASTIC SHELLS
Impact of a flight vehicle on a spherical shell
--- German book A75-39223

ELECTRIC EQUIPMENT
Airborne electronics for automated flight systems
N75-29011

ELECTRIC GENERATORS
The light industrial gas turbine: Past and future
[BLL-CE-TRANS-6395-(9022.09)] N75-28063

ELECTROMAGNETIC PULSES
Induced currents on two dimensional
electromagnetic planar structures
[AD-A005733] N75-29339

ELEVATORS (CONTROL SURFACES)
Influence of rigidity and damping in an elevator
control system on the longitudinal stability of
an aircraft and on elevator vibrations A75-39340

EMISSION SPECTRA
Firebird interferometer --- for observation of
infrared plume emission
[AD-A005815] N75-29395

ENERGY CONSERVATION
Design of short haul aircraft for fuel conservation
[SAE PAPER 750587] A75-40502

ENERGY SOURCES

SUBJECT INDEX

- Fuel conservation possibilities for terminal area compatible transport aircraft
[AIAA PAPER 75-1036] A75-41698
- ENERGY SOURCES**
The long term energy problem and aeronautics N75-29012
- ENGINE CONTROL**
Integrated flight/propulsion control by state regulation
[AIAA PAPER 75-1075] A75-41641
- ENGINE DESIGN**
Analysis of response requirements for V/STOL lift/cruise engines used to provide height and moment control
[AIAA PAPER 75-1014] A75-39514
Quiet clean short-haul experimental engine /QCSEE/ design rationale
[SAE PAPER 750605] A75-40513
Installation effects on the CF6-50 in the YC-14 aircraft
[SAE PAPER 750607] A75-40514
Design of jet engine rotors for long life
[SAE PAPER 750619] A75-40524
Engine design considerations for 2nd generation supersonic transports
[SAE PAPER 750628] A75-40530
Engineering calculations of gas turbine engines by the method of small deviations /3rd revised and enlarged edition/ --- Russian book A75-40593
The influence of engine/transmission/governor on tilting propeller aircraft dynamics
[NASA-TM-X-62455] N75-28050
Calculation of aircraft engine turbines. (Gasdynamic calculation: Blade profiling)
[NASA-TT-F-16367] N75-29120
- ENGINE FAILURE**
Disc failures - A cause for concern A75-40532
- ENGINE INLETS**
Propulsion system configuration development for the B-1 strategic bomber
[AIAA PAPER 75-1040] A75-39532
Potential and viscous flow prediction in V/STOL propulsion system inlets
[NASA-TM-X-71776] N75-29110
Experimentally determined aeroacoustic performance and control of several sonic inlets
[NASA-TM-X-71767] N75-29353
- ENGINE MONITORING INSTRUMENTS**
Maximum installed engine utilization through disciplined health monitoring --- of commercial aircraft engine systems
[SAE PAPER 750612] A75-40519
Aircraft engine speed and fuel flow signal conditioner with digital output
[APL/ME-NOTE-354] N75-29111
- ENGINE NOISE**
NASA refan program status
[SAE PAPER 750592] A75-40507
Estimation of subsonic far-field jet-mixing noise
[ESDU-74002] N75-29103
- ENGINE TESTS**
F-15 propulsion system design and development
[AIAA PAPER 75-1042] A75-39533
F-15 propulsion flight testing experience
[AIAA PAPER 75-1052] A75-39539
Full-scale aerodynamic and engine testing of the APL Syndel Mk 6 RPV
[AD-A006283] N75-29099
- ENVIRONMENT EFFECTS**
The control of aircraft noise A75-39334
Impact erosion - A serious environmental threat to aircraft and missiles

Wing with stores flutter on variable sweep wing aircraft
N75-28017
- FILAMENT WINDING**
Kerimid 353 bis-maleimide laminating resin
A75-40972
- FINITE ELEMENT METHOD**
Theory for calculating a wing of small aspect ratio from a discrete-continuous calculation scheme /matrix differential equation of axial displacements/
A75-40905
- PINS**
The aerodynamic characteristics of wrap-around fins, including fold angle at Mach numbers from 0.5 to 3.0
[AD-A005574] N75-28040
- FIRE CONTROL**
Combat Energy Maneuverability Display - CEMD /Flight dynamic and fire control information integration/
A75-41411
- FLAPS (CONTROL SURFACES)**
Advanced high lift design through analytical/experimental techniques
[AIAA PAPER 75-992] A75-41692
- FLAT PLATES**
Downwash during supersonic flow about a plate
A75-39857
- FLAT SURFACES**
A leading edge heating array and a flat surface heating array - operation, maintenance and repair manual
[NASA-CR-144357] N75-29088
- FLIGHT CHARACTERISTICS**
Vibrations measured in the passenger cabins of two jet transport aircraft
[NASA-TN-D-7923] N75-29037
- FLIGHT CONDITIONS**
Ride-quality testing under controlled flight conditions
[AIAA PAPER 75-987] A75-39502
- FLIGHT CONTROL**
In-flight simulation of the light weight fighters
[AIAA PAPER 75-985] A75-39500
Northrop YF-17 ground testing and simulation
[AIAA PAPER 75-986] A75-39501

FLIGHT HAZARDS

SUBJECT INDEX

Analysis of response requirements for V/STOL lift/cruise engines used to provide height and moment control
[AIAA PAPER 75-1014] A75-39514

Lateral-directional stability augmentation methods for the STOL flight regime
[AIAA PAPER 75-1028] A75-39523

The use of in-flight simulation to develop control system and display requirements for conventional and V/STOL airplanes
A75-41415

Digital flight control for advanced fighter aircraft
[AIAA PAPER 75-1086] A75-41651

YC-14 digital flight control data management
[AIAA PAPER 75-1087] A75-41652

A design study for a remotely piloted vehicle, automatic landing system
[AD-A005285] N75-28059

Status and trends in active control technology
N75-29015

Flight control and the effectiveness of an aviation system
[NASA-TT-P-16262] N75-29126

FLIGHT HAZARDS

Vortex-related accidents over the ten year period 1964 - 1973
[AD-A010111] N75-29065

FLIGHT INSTRUMENTS

Device for determining the location of the maximum climb rate of an ascending air current --- for glider flight applications
A75-41100

Vertical Display/Master Monitor Display
A75-41408

Combat Energy Maneuverability Display - CEMD /Flight dynamic and fire control information integration/
A75-41411

FLIGHT OPTIMIZATION

Aircraft optimal weapon delivery maneuvers based on extended energy management --- air-to-air missile launching
[AIAA PAPER 75-1076] A75-41642

Optimum flight profiles for short haul missions
[AIAA PAPER 75-1124] A75-41684

FLIGHT PATHS

Optimum flight profiles for short haul missions
[AIAA PAPER 75-1124] A75-41684

FLIGHT PLANS

Flight control and the effectiveness of an aviation system
[NASA-TT-P-16262] N75-29126

FLIGHT SAFETY

Air safety - The view from the cockpit
A75-41703

Flight safety work of the German Aviation and Space Research Institute
[DLR-MITT-75-05] N75-29070

FLIGHT SIMULATION

Parallelism in commercial and military use of simulation
[AIAA PAPER 75-971] A75-39496

In-flight simulation of the light weight fighters
[AIAA PAPER 75-985] A75-39500

Northrop YF-17 ground testing and simulation
[AIAA PAPER 75-986] A75-39501

Application of active control technology to aircraft ride smoothing
[AIAA PAPER 75-1029] A75-39524

The use of in-flight simulation to develop control system and display requirements for conventional and V/STOL airplanes
A75-41415

Conflict resolution maneuvers in an Intermittent Positive Control system --- ground based automatic aircraft collision avoidance model
[AIAA PAPER 75-1125] A75-41685

Flight simulation of the model 347 advanced tandem-rotor helicopter
[AD-A005050] N75-28052

Engineering simulation evaluation of the two-segment noise abatement approach in the Douglas DC-8-61
[NASA-CR-137665] N75-29121

A simulation study of active feedback suppression of dynamic response in helicopter rotor blades
[NASA-CR-132711] N75-29127

FLIGHT STABILITY TESTS

Application of active control technology to aircraft ride smoothing
[AIAA PAPER 75-1029] A75-39524

Free-flight model dynamic stability measurements on a not-so-slender wing/fin combination at zero and small lift, Mach number equals 0.8 to 2.0
[ARC-CP-1315] N75-29051

FLIGHT TESTS

Northrop/United States Air Force F-5E Aircraft Fatigue Structural Integrity Program
[AIAA PAPER 75-988] A75-39503

MRCA flight flutter testing
[AIAA PAPER 75-1033] A75-39527

Performance compatibility and flight testing of B-52 CCV systems
[AIAA PAPER 75-1035] A75-39528

F-15 propulsion flight testing experience
[AIAA PAPER 75-1052] A75-39539

Determination of aerodynamic coupling derivatives through flight test
[AIAA PAPER 75-1119] A75-41680

Flight experience with time-of-arrival control for STOL aircraft in the terminal area
[AIAA PAPER 75-1126] A75-41686

Techniques for determining propulsion system forces for accurate high speed vehicle drag measurements in flight
[AIAA PAPER 75-964] A75-41689

DC-9 flight testing of the refanned JT8D engine
[AIAA PAPER 75-998] A75-41693

Application of steep angle approach in an engineering and flight test program
[AD-A005074] N75-28053

Army preliminary evaluation 1: RV-1D/quick look 2 aircraft
[AD-A005220] N75-28058

Baseline measurement of the noise generated by a short-to-medium range jet transport flying standard IIS approaches and level flyovers
[NASA-TM-X-72760] N75-29119

FLIGHT TIME

A direct time history study of the response of an airplane to nonstationary turbulence
[AD-A006159] N75-29102

FLIGHT VEHICLES

Calculation of supersonic inviscid flow about a pyramidal-body model of a delta-shaped vehicle
A75-40254

FLOW CHARACTERISTICS

The effect of the surface roughness of blade profiles on the flow characteristics of a turbine --- German book
A75-39220

On wake vortex alleviation
N75-29010

FLOW DISTRIBUTION

Optimum performance and potential flow field of hovering rotors
[NASA-CR-137705] N75-28024

Numerical computation of three-dimensional blunt body flow fields with an impinging shock
[NASA-CR-143312] N75-29038

Technical evaluation report on fluid dynamics panel symposium on Airframe/Propulsion --- a discussion of air intakes, nozzle flow, and flow distribution
[AGARD-AR-81] N75-29114

An improved source flow characteristic technique for the analysis of scramjet exhaust flow fields
[NASA-CR-132697] N75-29361

Measurements at the leeward side of a cone at large incidences in supersonic flow
[VTH-186] N75-29370

FLOW GEOMETRY

The structure of high-pressure jets of low density issuing from a supersonic nozzle
A75-39981

FLUIDIC CIRCUITS

A fluidically controlled aircraft environmental system
[ASME PAPER 75-ENAS-7] A75-40894

FLUTTER

UK Jaguar external store flutter clearance
N75-28013

Flutter of wings equipped with large engines in pod
N75-28014

- Calculation of aerodynamic loads on oscillating wing/store combinations in subsonic flow N75-28015
- FLUTTER ANALYSIS**
- Flutter investigations on a combat aircraft with a command and stability augmentation system [AIAA PAPER 75-1025] A75-39520

- GERMANY**
- Flight safety work of the German Aviation and Space Research Institute [DLR-MITT-75-05] N75-29070
- GLASS FIBER REINFORCED PLASTICS**
- The results of fabrication and testing of the prototype composite rotor blades for HLH and UTTAS --- Heavy Lift Helicopter and Utility Tactical Transport Aircraft System [AIAA PAPER 75-1010] A75-41694

GLIDERS

Device for determining the location of the maximum climb rate of an ascending air current --- for glider flight applications
A75-41100

GOVERNMENT PROCUREMENT
Aeronautics in the American Society
N75-29002

GRAPHITE
Integrally stiffened graphite/epoxy construction --- for wingboxes
A75-40960

GRAVITY ANOMALIES
Accuracy improvement in a gravity gradiometer-aided cruise inertial navigator subjected to deflections of the vertical [AIAA PAPER 75-1090]
A75-41655
The use of autocorrelation functions to predict the effects of vertical deflections on aircraft navigation [AIAA PAPER 75-1101]
A75-41663

GRAVITY GRADIOMETERS
Propagation of gravity gradiometer errors in an airborne inertial navigation system [AIAA PAPER 75-1089]
A75-41654
Accuracy improvement in a gravity gradiometer-aided cruise inertial navigator subjected to deflections of the vertical [AIAA PAPER 75-1090]
A75-41655

GROUND EFFECT
The jet flap wing in proximity to the ground, giving particular attention to large angles of attack and large jet-flap angles --- German book
A75-41233

GROUND EFFECT MACHINES
Air cushion take-off and landing systems for aircraft
A75-41798

GROUND SUPPORT SYSTEMS
Whither all weather - An airline engineer's point of view --- landing system design [SAE PAPER 750600]
A75-40509

GROUND TESTS
Northrop YF-17 ground testing and simulation [AIAA PAPER 75-986]
A75-39501

GROUND-AIR-GROUND COMMUNICATIONS
DABS link performance considerations [AD-A009429]
N75-29078

GRUMMAN AIRCRAFT
High-performance jet-V/STOL development [AIAA PAPER 75-1013]
A75-39513

GUST ALLEVIATORS
The C-5A active load alleviation system [AIAA PAPER 75-991]
A75-39504
Status and trends in active control technology
N75-29015

GUST LOADS
On the response of an airplane to sinusoidal gust
A75-41474
Measurement and analysis of unsteady aerodynamic force for the vertical gust on an airplane model in the NAL gust wind tunnel --- swept wing interference tests [NAL-TR-399]
N75-29027

GUSTS
Wind tunnel generation of sinusoidal lateral and longitudinal gusts by circulation of twin parallel airfoils [NASA-CR-137547]
N75-29351

GYROCOMPASSES
Gyroscopes /2nd revised and enlarged edition/ --- Russian book
A75-40194
Design of an improved azimuth reference system [AIAA PAPER 75-1083]
A75-41648

GYROSCOPES
Gyroscopes /2nd revised and enlarged edition/ --- Russian book
A75-40194

GYROSTABILIZERS
Gyroscopes /2nd revised and enlarged edition/ --- Russian book
A75-40194

H

HEAT RESISTANT ALLOYS
Air Force technical objective document, Fiscal year 1975 --- composite materials, heat resistant alloys, thermal insulation, protective coatings [AD-A005386]
N75-28961

HEATING EQUIPMENT
A leading edge heating array and a flat surface heating array - operation, maintenance and repair manual [NASA-CR-144357]
N75-29088

HEAVY LIFT HELICOPTERS
The results of fabrication and testing of the prototype composite rotor blades for HLH and UTTAS --- Heavy Lift Helicopter and Utility Tactical Transport Aircraft System [AIAA PAPER 75-1010]
A75-41694

HELICOPTER DESIGN
Static fatigue behavior of cellulose and polyamide materials --- helicopter external load slings
A75-40967
The results of fabrication and testing of the prototype composite rotor blades for HLH and UTTAS --- Heavy Lift Helicopter and Utility Tactical Transport Aircraft System [AIAA PAPER 75-1010]
A75-41694
Fan-in-fuselage advanced antitorque system [AD-A005049]
N75-28055
Failsafe/safe-life interface criteria [AD-A006131]
N75-29462

HELICOPTER PERFORMANCE
Short haul transportation - The helicopter's time is now [SAE PAPER 750598]
A75-40506
Operational experiences of a commercial helicopter flown in a large metropolitan area [NASA-TN-D-8000]
N75-28045
Flight simulation of the model 347 advanced tandem-rotor helicopter [AD-A005050]
N75-28052
Application of steep angle approach in an engineering and flight test program [AD-A005074]
N75-28053

HELICOPTER PROPELLER DRIVE
Cooperative program for design, fabrication, and testing of graphite-epoxy composite helicopter shafting [AD-A005024]
N75-28244

HELICOPTER WAKES
Vortex wake behind a helicopter [AD-A005479]
N75-28038
Unsteady vortex lattice techniques applied to wake formation and performance of the statically thrusting propeller [NASA-CR-132686]
N75-29031

HELICOPTERS
Conceptual design study of 1985 commercial VTOL transports that utilize rotors [NASA-CR-2532]
N75-28043
Automatic external load acquisition by helicopter [AD-A005051]
N75-29097
Application of the helicopter KA-26 to large-scale aerial photography [AD-A005950]
N75-29393

HIGH ALTITUDE
Aircraft altitude emissions - Fundamental concepts and future R & D requirements [AIAA PAPER 75-1017]
A75-39515
Jet aircraft emissions during cruise - Present and future [AIAA PAPER 75-1018]
A75-39516

HOLOGRAPHY
Holographic horizontal display system
A75-41405

HOMING DEVICES
Inertially aided ranging for guidance systems [AIAA PAPER 75-1109]
A75-41671

HONEYCOMB STRUCTURES
Aerospace sandwich materials
A75-39351

HORIZONTAL TAIL SURFACES
Use of short period frequency requirements in horizontal tail sizing
A75-40550

SUBJECT INDEX

INTERNAL COMPRESSION INLETS

Longitudinal motions of aircraft involving high angles of attack
[ARC-R/M-3753] N75-29094

HOT-WIRE ANEMOMETERS
Icing tunnel test: Hot-film anemometer
[AD-A005044] N75-28404

HOVERING
Optimum performance and potential flow field of hovering rotors
[NASA-CR-137705] N75-28024

HUBS
Major Item Special Study (MISS), OH-1H main rotor hub assembly
[AD-A005217] N75-28057

HUMAN FACTORS ENGINEERING
Ride-quality testing under controlled flight conditions
[AIAA PAPER 75-987] A75-39502
Application of active control technology to aircraft ride smoothing
[AIAA PAPER 75-1029] A75-39524

HUMAN REACTIONS
Annoyance resulting from intrusion of aircraft sounds upon various activities
[NGR-43-008-008] N75-29112

HYDRAULIC EQUIPMENT
P-89 hydraulic actuator combinatorial geometric representation
[AD-A006435] N75-29101

HYDROCARBON FUELS
The long term energy problem and aeronautics
N75-29012

HYDROGEN FUELS
Future hydrogen fueled commercial transports
[SAE PAPER 750615] A75-40521

HYPERSONIC AIRCRAFT
Joint USAF/NASA hypersonic research aircraft study
[AIAA PAPER 75-1039] A75-39531

HYPERSONIC FLOW
Numerical investigation of the flow of a viscous, heat-conducting gas past a blunt body with finite dimensions
A75-40255
Solution of the inverse problem of the hypersonic gas flow past a slender blunted body
A75-40912

HYPERSONIC VEHICLES
The problem of the optimal form of lifting bodies in Newtonian flow
A75-40260

ICE FORMATION
Icing tunnel test: Hot-film anemometer
[AD-A005044] N75-28404

IDEAL GAS
Solution of the inverse problem of the hypersonic gas flow past a slender blunted body
A75-40912
Vortex method for calculating a wing profile of arbitrary shape
A75-40913

IMPACT DAMAGE
Impact of a flight vehicle on a spherical shell --- German book
A75-39223
Crashworthy helicopter gunner's seat investigation
[AD-A005563] N75-28054

IMPACT TESTS
The impact between a liquid drop and an elastic half-space
[PB-241155/11] N75-29378

IN-FLIGHT MONITORING
The use of in-flight simulation to develop control system and display requirements for conventional and V/STOL airplanes
A75-41415
Air safety as seen from the tower
A75-41702

INCOMPRESSIBLE BOUNDARY LAYER
Measurements in an incompressible three-dimensional turbulent boundary layer, under infinite swept-wing conditions, and comparison with theory
A75-40206

INCOMPRESSIBLE FLOW
Second-order small-perturbation theory for finite wings in incompressible flow --- two dimensional swept wings
[ARC-R/M-3759] N75-29052

INDUSTRIAL PLANTS
The light industrial gas turbine: Past and future
[BLL-CE-TRANS-6395-(9022.09)] N75-28063

INERTIAL GUIDANCE
Inertially aided ranging for guidance systems
[AIAA PAPER 75-1109] A75-41671

INERTIAL NAVIGATION
Propagation of gravity gradiometer errors in an airborne inertial navigation system
[AIAA PAPER 75-1089] A75-41654
Accuracy improvement in a gravity gradiometer-aided cruise inertial navigator subjected to deflections of the vertical
[AIAA PAPER 75-1090] A75-41655

INFINITE SPAN WINGS
The jet flap wing in proximity to the ground, giving particular attention to large angles of attack and large jet-flap angles --- German book
A75-41233

INFORMATION SYSTEMS
Engine maintenance management program requires information
[SAE PAPER 750613] A75-40520

INFRARED DETECTORS
Feasibility study for a dual field of view-single detector array infrared system
[AD-A005658] N75-28875

INFRARED SPECTROMETERS
Firebird interferometer --- for observation of infrared plume emission
[AD-A005815] N75-29395

INLET NOZZLES
Noise suppression with high Mach number inlets
[NASA-CR-143314] N75-29115

INLET PRESSURE
Experimentally determined aeroacoustic performance and control of several sonic inlets
[NASA-TN-X-71767] N75-29353

INSTALLING
Installation effects on the CP6-50 in the YC-14 aircraft
[SAE PAPER 750607] A75-40514

INSTRUMENT ERRORS
Design of an improved azimuth reference system
[AIAA PAPER 75-1083] A75-41648
Propagation of gravity gradiometer errors in an airborne inertial navigation system
[AIAA PAPER 75-1089] A75-41654
Accuracy improvement in a gravity gradiometer-aided cruise inertial navigator subjected to deflections of the vertical
[AIAA PAPER 75-1090] A75-41655
Inertially aided ranging for guidance systems
[AIAA PAPER 75-1109] A75-41671

INSTRUMENT LANDING SYSTEMS
Application of steep angle approach in an engineering and flight test program
[AD-A005074] N75-28053
Reliable line signaling techniques for the FAA GRN-27(V) and CAT-3 ILS
[AD-A009881] N75-29077
TACAN and ILS station evaluation report, Loring AFB, Maine
[AD-A006416] N75-29084
Baseline measurement of the noise generated by a short-to-medium range jet transport flying standard ILS approaches and level flyovers
[NASA-TN-X-72760] N75-29119

INTERFERENCE LIFT
Low-speed upwash interference on a transport model in a rectangular slotted-wall wind tunnel
[NASA-TN-X-3218] N75-28026

INTERMITTENCY
Intermittent positive control computer algorithm for test bed experiments --- collision avoidance - aircraft guidance
[AD-A009215] N75-29068

INTERNAL COMPRESSION INLETS
A throat-bypass stability system for a YF-12 aircraft research inlet using self-acting mechanical valves
[NASA-TN-X-71779] N75-29128

INTERNATIONAL COOPERATION

SUBJECT INDEX

INTERNATIONAL COOPERATION

The convention on international combined transport of goods - A new start also with regard to air transport

A75-40200

INVISCID FLOW

Calculation of supersonic inviscid flow about a pyramidal-body model of a delta-shaped vehicle

A75-40254

Transonic data memorandum: Second-order method for estimating the subcritical pressure distribution on a two-dimensional aerofoil in compressible inviscid flow

N75-29029

Higher order wind tunnel corrections for a two-dimensional circular arc lifting aerofoil in a closed rectangular wind tunnel

N75-29034

[ARL/A-NOTE-349]

J

JAGUAR AIRCRAFT

European collaborative military aircraft programme - Jaguar

A75-39021

JET AIRCRAFT

High-performance jet-V/STOL development

[AIAA PAPER 75-1013]

A75-39513

Vibrations measured in the passenger cabins of two jet transport aircraft

[NASA-TN-D-7923]

N75-29037

JET AIRCRAFT NOISE

The control of aircraft noise

A75-39334

NASA refan program status

[SAE PAPER 750592]

A75-40507

Full-scale upper-surface-blown flap noise --- for

short haul STOL aircraft

[SAE PAPER 750609]

A75-40516

DC-9 flight testing of the refanned JT8D engine

[AIAA PAPER 75-998]

A75-41693

Analytical simulation of the far-field jet noise and the unsteady jet flow-field by a model of periodic shedding of vortex ring from the jet exit

[NASA-CR-143211]

N75-28021

Noise abatement by the interaction of cold coaxial model jets

N75-28062

Numerical simulation of turbulent jet noise, part 1

[NASA-CR-132693]

N75-28069

Acoustic radiation from lined, unflanged ducts:

Acoustic source distribution program

[NASA-CR-120849]

N75-28849

Acoustic radiation from lined unflanged ducts:

Directivity index program

[NASA-CR-120850]

N75-28850

Acoustic radiation from lined, unflanged ducts:

Duct termination impedance program

[NASA-CR-120851]

N75-28851

Establishing certification/design criteria for advanced supersonic aircraft utilizing acceptance, interference, and annoyance response to simulated sonic booms by persons in their homes

[AD-A009656]

N75-29090

Estimation of subsonic far-field jet-mixing noise

[ESDU-74002]

N75-29103

JET ENGINES

Design of jet engine rotors for long life

[SAE PAPER 750619]

A75-40524

Evaluation by step response tests of prototype relief valves designed for F-12 inlet stability bleed system

[NASA-TN-X-3262]

N75-29118

Digital fuel controller for lift jet engine

[NAL-TR-389]

N75-29122

JET EXHAUST

Jet aircraft emissions during cruise - Present and future

[AIAA PAPER 75-1018]

A75-39516

Thrust/drag analysis for a front fan nacelle having two separate co-axial exhaust streams --- for turbofan engines

[ARC-CP-1311]

N75-29049

JET FLAPS

The jet flap wing in proximity to the ground, giving particular attention to large angles of attack and large jet-flap angles --- German book

A75-41233

JET FLOW

Analytical simulation of the far-field jet noise and the unsteady jet flow-field by a model of periodic shedding of vortex ring from the jet exit

[NASA-CR-143211]

N75-28021

JET IMPINGEMENT

Numerical computation of three-dimensional blunt body flow fields with an impinging shock

[NASA-CR-143312]

N75-29038

JET THRUST

Thrust/drag analysis for a front fan nacelle

having two separate co-axial exhaust streams --- for turbofan engines

[ARC-CP-1311]

N75-29049

K

KALMAN FILTERS

The employment of Kalman filter technology for the improvement of the signal quality of a microwave beacon system

A75-39090

Inertially aided ranging for guidance systems

[AIAA PAPER 75-1109]

A75-41671

L

LAMINAR FLOW

Information on the use of data items in the series bodies 02.04

[ESDU-02.04.00]

N75-29028

LAMINATES

Kerimid 353 bis-maleimide laminating resin

A75-40972

LANDING AIDS

Whither all weather - An airplane manufacturer's point of view --- all weather landing systems

[SAE PAPER 750601]

A75-40510

LANDING GEAR

Operational reliability of aircraft wheels ---

Russian book

A75-40174

Air cushion take-off and landing systems for aircraft

A75-41798

LASER APPLICATIONS

Laser Doppler velocimeter system simulation for sensing aircraft wake vortices. Part 2:

Processing and analysis of LDV data (for runs 1023 and 2023)

[NASA-CR-120758]

N75-28394

Laser Doppler velocimeter system simulation for sensing aircraft wake vortices. Part 3: The problem of reflection from the secondary mirror

[NASA-CR-120759]

N75-28395

LATERAL CONTROL

Wind modeling and lateral control for automatic landing

[AIAA PAPER 75-1077]

A75-41643

Optimal design of a Mini-RPV lateral autopilot

[AIAA PAPER 75-1121]

A75-41682

LATERAL STABILITY

Lateral-directional stability augmentation methods for the STOL flight regime

[AIAA PAPER 75-1028]

A75-39523

Free-flight model dynamic stability measurements on a not-so-slender wing/fan combination at zero and small lift, Mach number equals 0.8 to 2.0

[ARC-CP-1315]

N75-29051

LEADING EDGES

Augmentation of vortex lift by spanwise blowing --- wind tunnel testing for swept wing fighter aircraft

[AIAA PAPER 75-993]

A75-39505

A leading edge heating array and a flat surface heating array - operation, maintenance and repair manual

[NASA-CR-144357]

N75-29088

LIFT

Analysis of response requirements for V/STOL lift/cruise engines used to provide height and moment control

[AIAA PAPER 75-1014]

A75-39514

LIFT AUGMENTATION

Augmentation of vortex lift by spanwise blowing --- wind tunnel testing for swept wing fighter aircraft

[AIAA PAPER 75-993]

A75-39505

SUBJECT INDEX

METEOROLOGICAL PARAMETERS

Advanced high lift design through analytical/experimental techniques [AIAA PAPER 75-992] A75-41692

LIFT DEVICES

Advanced high lift design through analytical/experimental techniques [AIAA PAPER 75-992] A75-41692

Prediction of the steady aerodynamic loads of lifting surfaces having sharp-edge separation N75-28007

A lifting surface theory method for treating swept or slender wings in attached subsonic flow [ARC-R/M-3760] N75-29053

LIFT FANS

Design of a V/STOL technology airplane [AIAA PAPER 75-1012] A75-41695

Summary of model VTOL lift fan tests conducted at NASA Lewis Research Center [NASA-TM-X-71778] N75-29106

LIFTING BODIES

The problem of the optimal form of lifting bodies in Newtonian flow A75-40260

LIFTING ROTORS

Optimum performance and potential flow field of hovering rotors [NASA-CR-137705] N75-28024

Conceptual engineering design studies of 1985-era commercial VTOL and STOL transports that utilize rotors [NASA-CR-2545] N75-28044

LIGHT AIRCRAFT

Interior noise levels of two propeller-driven light aircraft [NASA-TM-X-72716] N75-28066

LINEAR VIBRATION

Vibration tests of a structure with dry friction A75-39330

LIQUID HYDROGEN

Future hydrogen fueled commercial transports [SAE PAPER 750615] A75-40521

LOAD DISTRIBUTION (FORCES)

On the application of subsonic linearised wing theory to second-order forces and moments [ARC-R/M-3758] N75-28031

General principles and mathematical models N75-28032

Edge forces and roll-rate derivatives N75-28033

The computation of aerodynamic loads on helicopter blades in forward flight, using the method of the acceleration potential [VTM-189] N75-29055

LOADING OPERATIONS

Automatic external load acquisition by helicopter [AD-A005051] N75-29097

LONGITUDINAL CONTROL

Longitudinal motions of aircraft involving high angles of attack [ARC-R/M-3753] N75-29094

LONGITUDINAL STABILITY

Influence of rigidity and damping in an elevator control system on the longitudinal stability of an aircraft and on elevator vibrations A75-39340

Transonic wind tunnel investigation of thrust effects on the longitudinal stability characteristics of several body-fin configurations (sting-mounted model with normal-jet plume simulator) [AD-A005152] N75-28042

The dynamic stability derivatives of a slender wing at zero and moderate life. A comparison of theory with free-flight model tests, Mach number equals 0.8 to 2.0 [ARC-CP-1310] N75-29048

Free-flight model dynamic stability measurements on a not-so-slender wing/fin combination at zero and small lift, Mach number equals 0.8 to 2.0 [ARC-CP-1315] N75-29051

LOW ASPECT RATIO WINGS

Effects of wing bend on the aerodynamic characteristics of a low aspect ratio oblique wing [AIAA PAPER 75-995] A75-39507

Theory for calculating a wing of small aspect ratio from a discrete-continuous calculation scheme /matrix differential equation of axial displacements/ A75-40905

LOW DENSITY FLOW

The structure of high-pressure jets of low density issuing from a supersonic nozzle A75-39981

LOW FREQUENCIES

Common antenna preamplifier-isolator for VLF-LF receivers [NASA-CR-143237] N75-28278

LOW SPEED WIND TUNNELS

The experimental cascade performance of NACA compressor profiles at low Reynolds number A75-39350

A large-scale low-speed tunnel test of a canard configuration with spanwise blowing [AIAA PAPER 75-994] A75-39506

M

MAINTENANCE

A leading edge heating array and a flat surface heating array - operation, maintenance and repair manual [NASA-CR-144357] N75-29088

MAN MACHINE SYSTEMS

Pilot information requirements for air combat maneuvering A75-41410

MANIPULATORS

Automatic external load acquisition by helicopter [AD-A005051] N75-29097

MANUAL CONTROL

G-load measuring and indicator apparatus [NASA-CASE-ARC-10806-1] N75-29381

MANUALS

A leading edge heating array and a flat surface heating array - operation, maintenance and repair manual [NASA-CR-144357] N75-29088

MAPPING

COMED - A combined display including a full electronic facility and a topographical moving map display --- Combined Map and Electronic Display for fighter aircraft A75-41404

MARKET RESEARCH

Challenges of short-haul air transportation [SAE PAPER 750586] A75-40501

MATHEMATICAL MODELS

Mathematical description of a wing surface A75-40910

Wind modeling and lateral control for automatic landing [AIAA PAPER 75-1077] A75-41643

Analytical simulation of the far-field jet noise and the unsteady jet flow-field by a model of periodic shedding of vortex ring from the jet exit [NASA-CR-143211] N75-28021

General principles and mathematical models N75-28032

MECHANICAL PROPERTIES

Fiber composite structures --- review A75-38901

Processable high temperature resistant polymer matrix materials A75-39482

Characterization of 8-wil boron/aluminum material --- tensile, shear and fatigue tests A75-40963

METAL BONDING

Preproduction evaluation of an improved titanium surface prebonding process A75-40992

METAL MATRIX COMPOSITES

Metal matrix composites for aircraft propulsion systems A75-39483

Forging of metal-matrix composites: Forming limit criteria and applications to process design N75-28193

METAL-METAL BONDING

Weldbonding of aluminum aircraft structures A75-40985

METEOROLOGICAL PARAMETERS

A GASP 4 simulation of tactical air interdiction using a choice of weapons loads and continuously changing weather conditions [AD-A006349] N75-29417

MICROWAVE ANTENNAS

Review of presently employed narrow-beam microwave antennas. II

A75-39268

MICROWAVE LANDING SYSTEMS

The employment of Kalman filter technology for the improvement of the signal quality of a microwave beacon system

A75-39090

The choice of the MLS technique in the United States

A75-39324

MIDAIR COLLISIONS

Civil aviation midair collisions analysis: 1972 added to 1964 - 1971 results --- statistical analysis

N75-29064

MILITARY AIR FACILITIES

TACAN and ILS station evaluation report, Loring AFB, Maine

N75-29084

MILITARY AIRCRAFT

Digital multimode flight control system

A75-41650

Automatic all-weather landing control

A75-41699

Investigation of reinforced plastics for naval aircraft electromagnetic (EM) windows

N75-28243

Application of differential game theory to role-determination in aerial combat

N75-28822

Aeronautics in the American Society

N75-29002

The next forty years in aviation

N75-29007

Optimization of the time between aircraft overhauls by minimizing maintenance cost

N75-29100

A GASP 4 simulation of tactical air interdiction using a choice of weapons loads and continuously changing weather conditions

N75-29417

Desert storage test program

N75-29454

USAF aircraft pollution emission factors and landing and takeoff LTO cycles

N75-29582

MILITARY HELICOPTERS

Crashworthy helicopter gunner's seat investigation

N75-28054

Fatigue damage equivalence of field and simulated vibrational environments

N75-29453

MILITARY TECHNOLOGY

Parallelism in commercial and military use of simulation

A75-39496

MILITARY VEHICLES

Fatigue damage equivalence of field and simulated vibrational environments

N75-29453

MINICOMPUTERS

The concept of an interactive graphic design system /IGDS/ with distributed computing

A75-39492

MINUTEMAN ICBM

C-5A air launch of Minuteman I missile

A75-39494

MIRRORS

Laser Doppler velocimeter system simulation for sensing aircraft wake vortices. Part 3: The problem of reflection from the secondary mirror

N75-28395

MISSILE CONTROL

Determination of aerodynamic coupling derivatives through flight test

A75-41680

MISSILE DESIGN

Impact erosion - A serious environmental threat to aircraft and missiles

A75-40860

The aerodynamic characteristics of wrap-around fins, including fold angle at Mach numbers from 0.5 to 3.0

N75-28040

MISSILE LAUNCHERS

C-5A air launch of Minuteman I missile

A75-39494

N

NACELLES

Flutter of wings equipped with large engines in pod

N75-28014

The effect of a pylon-mounted nacelle on the flutter behaviour of a wing-pylon-nacelle configuration

N75-29056

Conceptual design study of advanced acoustic-composite nacelles

N75-29093

NASA PROGRAMS

NASA refan program status

A75-40507

The NASA research program on propulsion for supersonic cruise aircraft

A75-40531

NAVIER-STOKES EQUATION

Numerical computation of three-dimensional blunt body flow fields with an impinging shock

N75-29038

NICKEL CADMIUM BATTERIES

Development of an aircraft battery conditioner/analyzer --- emphasizing nickel cadmium battery

N75-28533

NITROGEN OXIDES

Aircraft altitude emissions - Fundamental concepts and future R & D requirements

A75-39515

Jet aircraft emissions during cruise - Present and future

A75-39516

NOISE INTENSITY

Noise levels in the CC-109, CC-115, and CC-117 aircraft

N75-28065

NOISE MEASUREMENT

Full-scale upper-surface-blown flap noise --- for short haul STOL aircraft

A75-40516

DC-9 flight testing of the refanned JT8D engine

A75-41693

Interior noise levels of two propeller-driven light aircraft

N75-28066

Baseline measurement of the noise generated by a short-to-medium range jet transport flying standard ILS approaches and level flyovers

N75-29119

NOISE POLLUTION

The control of aircraft noise

A75-39334

Annoyance resulting from intrusion of aircraft sounds upon various activities

N75-29112

NOISE REDUCTION

The employment of Kalman filter technology for the improvement of the signal quality of a microwave beacon system

A75-39090

The control of aircraft noise

A75-39334

Analysis of the costs, effectiveness, and benefits of aircraft noise reduction programs

A75-40504

NASA refan program status

A75-40507

Quiet clean short-haul experimental engine /QCSEE/ design rationale

A75-40513

Noise reduction of EBP propulsive-lift systems --- Externally Blown Flaps

A75-40515

Noise abatement by the interaction of cold coaxial model jets

N75-28062

Trends in aircraft noise control

N75-29008

Reliable line signaling techniques for the FAA GRN-27(V) and CAT-3 ILS

N75-29077

Conceptual design study of advanced acoustic-composite nacelles

N75-29093

Noise suppression with high Mach number inlets

N75-29115

SUBJECT INDEX

PLUMES

Engineering simulation evaluation of the two-segment noise abatement approach in the Douglas DC-8-61
[NASA-CR-137665] N75-29121

Experimentally determined aeroacoustic performance and control of several sonic inlets
[NASA-TN-X-71767] N75-29353

NOISE TOLERANCE
Establishing certification/design criteria for advanced supersonic aircraft utilizing acceptance, interference, and annoyance response to simulated sonic booms by persons in their homes
[AD-A009656] N75-29090

NONLINEAR EQUATIONS
Differential thrust equations for a transient mode of engine operation
A75-40922

NORMAL SHOCK WAVES
Analytic investigation of transonic normal shock boundary layer interaction
[AD-A004980] N75-28041

NOTCH SENSITIVITY
Structure interpretation by consideration of vibration resistance in light construction
A75-39402

NOTCH TESTS
The effect of mean stress on the fatigue of aluminum alloys --- notched specimens
[S/T-MEMO-9/74] N75-29482

NOZZLE DESIGN
An improved numerical procedure for the parametric optimization of three dimensional scramjet nozzles --- supersonic combustion ramjet engines - computer programs
[NASA-CR-132695] N75-29359

NOZZLE FLOW
The structure of high-pressure jets of low density issuing from a supersonic nozzle
A75-39981

Technical evaluation report on fluid dynamics panel symposium on Airframe/Propulsion --- a discussion of air intakes, nozzle flow, and flow distribution
[AGARD-AR-81] N75-29114

NUMERICAL CONTROL
YC-14 flight control
[AIAA PAPER 75-1027] A75-39522

O

OBLIQUE WINGS
Effects of wing bend on the aerodynamic characteristics of a low aspect ratio oblique wing
[AIAA PAPER 75-995] A75-39507

OBSERVATION AIRCRAFT
Army preliminary evaluation 1: RV-1D/quick look 2 aircraft
[AD-A005220] N75-28058

OILS
A short study of the effect of a penetrant oil on the fatigue life of a riveted joint
[ARC-CP-1305] N75-29483

OPERATIONS RESEARCH
Flight control and the effectiveness of an aviation system
[NASA-TT-P-16262] N75-29126

OPTICAL DENSITY
Analysis of visibility conditions for aircraft landing in radiation fog
[BLL-M-23561-(5828.4P)] N75-28632

OPTICAL MEMORY (DATA STORAGE)
Holographic horizontal display system
A75-41405

OPTIMAL CONTROL
Gyroscopes /2nd revised and enlarged edition/ --- Russian book
A75-40194

Aircraft optimal weapon delivery maneuvers based on extended energy management --- air-to-air missile launching
[AIAA PAPER 75-1076] A75-41642

Digital flight control for advanced fighter aircraft
[AIAA PAPER 75-1086] A75-41651

OPTIMIZATION
The problem of the optimal form of lifting bodies in Newtonian flow
A75-40260

Optimal design of a Mini-RPV lateral autopilot
[AIAA PAPER 75-1121] A75-41682

Theoretical effect of modifications to the upper surface of two NACA airfoils using smooth polynomial additional thickness distributions which emphasize leading edge profile and which vary linearly at the trailing edge
[NASA-CR-137717] N75-29030

An improved numerical procedure for the parametric optimization of three dimensional scramjet nozzles --- supersonic combustion ramjet engines - computer programs
[NASA-CR-132695] N75-29359

P

PARABOLIC DIFFERENTIAL EQUATIONS
Parabolic method for solving the problem of a sonic gas flow about a thin symmetric profile
A75-40259

PARAGLIDERS
A theory for the calculation of conical paragliders with weak camber in supersonic flow --- German book
A75-39224

PARAMETERIZATION
A parametric study of wing store flutter
N75-28018

PASSENGER AIRCRAFT
Advanced subsonic aircraft concepts for passenger transportation
A75-39023

Ride-quality testing under controlled flight conditions
[AIAA PAPER 75-987] A75-39502

Airtransit's first six months of operating the Canadian STOL demonstration service
[SAE PAPER 750599] A75-40508

PAVEMENTS
Evaluation of experimental polyurethane-coated membranes
[AD-A005151] N75-28236

PENETRANTS
A short study of the effect of a penetrant oil on the fatigue life of a riveted joint
[ARC-CP-1305] N75-29483

PERFORMANCE PREDICTION
Theoretical and experimental study of a new method for prediction of profile drag of airfoil sections
[NASA-CR-2539] N75-28003

Prediction of the steady aerodynamic loads of lifting surfaces having sharp-edge separation
N75-28007

PERFORMANCE TESTS
The experimental cascade performance of NACA compressor profiles at low Reynolds number
A75-39350

Use of fly-by-wire to obtain performance improvements in a delta-canard design
[AIAA PAPER 75-1061] A75-41631

PERSONNEL DEVELOPMENT
Aeronautics in the American Society
N75-29002

PILOT PERFORMANCE
Pilot information requirements for air combat maneuvering
A75-41410

PILOT TRAINING
Parallelism in commercial and military use of simulation
[AIAA PAPER 75-971] A75-39496

PITCHING MOMENTS
Procedures for the design of low-pitching-moment airfoils
[NASA-TN-D-7982] N75-28004

PLANAR STRUCTURES
Induced currents on two dimensional electromagnetic planar structures
[AD-A005733] N75-29339

PLASTIC DEFORMATION
Impact of a flight vehicle on a spherical shell --- German book
A75-39223

PLASTIC FLOW
Low-flow, low pressure curing resins --- for graphite fiber/epoxy composites
A75-40973

PLUMES
Firebird interferometer --- for observation of infrared plume emission
[AD-A005815] N75-29395

PNEUMATIC EQUIPMENT

SUBJECT INDEX

PNEUMATIC EQUIPMENT

Small gas turbine auxiliary power units
[ASME PAPER 75-ENAS-1] A75-40896

POLICIES

An overview of low medium density short-haul air
transportation policy implementation
[SAE PAPER 750610] A75-40517

POLLUTION CONTROL

The control of aircraft noise
A75-39334
Aircraft altitude emissions - Fundamental concepts
and future R & D requirements
[AIAA PAPER 75-1017] A75-39515
Analysis of the costs, effectiveness, and benefits
of aircraft noise reduction programs
[SAE PAPER 750595] A75-40504
Quiet clean short-haul experimental engine
design rationale /QCSEZ/
[SAE PAPER 750605] A75-40513
Pollution control in continuous combustion
engines A75-40833

POLLUTION MONITORING

Instrumentation requirements relative to federal
aircraft emission regulations
A75-39084

POLYIMIDE RESINS

Static fatigue behavior of cellulose and polyamide
materials --- helicopter external load slings
A75-40967
Kerimid 353 bis-maleimide laminating resin
A75-40972

POLYIMIDES

PMR polyimides - Processable high temperature
composite matrix resins
A75-40999

POLYMER CHEMISTRY

Processable high temperature resistant polymer
matrix materials
A75-39482
Kerimid 353 bis-maleimide laminating resin
A75-40972

POLYMERIZATION

PMR polyimides - Processable high temperature
composite matrix resins
A75-40999

POLYURETHANE RESINS

Evaluation of experimental polyurethane-coated
membranes
[AD-A005151] N75-28236

POSITION ERRORS

The use of autocorrelation functions to predict
the effects of vertical deflections on aircraft
navigation
[AIAA PAPER 75-1101] A75-41663

POTENTIAL FIELDS

The computation of aerodynamic loads on helicopter
blades in forward flight, using the method of
the acceleration potential
[VTH-189] N75-29055

POTENTIAL FLOW

Vortex method for calculating a wing profile of
arbitrary shape
A75-40913

POWER SPECTRA

Effort of spanwise variation of turbulence on the
normal acceleration of airplanes with small span
relative to turbulence scale
[NASA-TM-X-72748] N75-29036

PREAMPLIFIERS

Common antenna preamplifier-isolator for VLF-LF
receivers
[NASA-CR-143237] N75-28278

PREDICTION ANALYSIS TECHNIQUES

Theoretical prediction of airplane stability
derivatives at subcritical speeds
[NASA-CR-132681] N75-29089
Potential and viscous flow prediction in V/STOL
propulsion system inlets
[NASA-TM-X-71776] N75-29110

PRESSURE DISTRIBUTION

Pressure distributions on a cambered wing body
configuration at subsonic Mach numbers
[NASA-TN-D-7946] N75-28029
Transonic data memorandum: Second-order method
for estimating the subcritical pressure
distribution on a two-dimensional aerofoil in
compressible inviscid flow
[ESDU-72025] N75-29029

PRESSURE DRAG

Opportunities for aerodynamic-drag reduction
N75-29016

PRESSURE REDUCTION

Evaluation by step response tests of prototype
relief valves designed for YF-12 inlet stability
bleed system
[NASA-TM-X-3262] N75-29118

PROBABILITY THEORY

Probabilistic design and structural fatigue ---
aircraft applications
A75-39824

PRODUCTION ENGINEERING

Aerospace sandwich materials
A75-39351
Forging of metal-matrix composites: Forming limit
criteria and applications to process design
N75-28193

PRODUCTION MANAGEMENT

Test results on computer graphics productivity for
aircraft design and fabrication
[AIAA PAPER 75-967] A75-39493

PROJECT MANAGEMENT

European collaborative military aircraft programme
- Jaguar
A75-39021
General aviation's future need for research
N75-29021

PROPELLER DRIVE

Interior noise levels of two propeller-driven
light aircraft
[NASA-TM-X-72716] N75-28066

PROPELLERS

Experimental and theoretical investigations on the
problem of propeller/wing interference up to
high angles of attack
[NASA-TT-P-16490] N75-29035

PROPULSION SYSTEM CONFIGURATIONS

Propulsion system configuration development for
the B-1 strategic bomber
[AIAA PAPER 75-1040] A75-39532
Engine design considerations for 2nd generation
supersonic transports
[SAE PAPER 750628] A75-40530
The NASA research program on propulsion for
supersonic cruise aircraft
[SAE PAPER 750629] A75-40531
Design of a V/STOL technology airplane
[AIAA PAPER 75-1012] A75-41695
Conceptual design study of advanced
acoustic-composite nacelles
[NASA-CR-132703] N75-29093
Application of real-time engine simulations to the
development of propulsion system controls
[NASA-TM-X-71764] N75-29108

PROPULSION SYSTEM PERFORMANCE

Metal matrix composites for aircraft propulsion
systems
A75-39483
P-15 propulsion system design and development
[AIAA PAPER 75-1042] A75-39533
Techniques for determining propulsion system
forces for accurate high speed vehicle drag
measurements in flight
[AIAA PAPER 75-964] A75-41689

PULSIVE EFFICIENCY

P-15 propulsion system design and development
[AIAA PAPER 75-1042] A75-39533

PROTECTIVE COATINGS

Evaluation of experimental polyurethane-coated
membranes
[AD-A005151] N75-28236
Air Force technical objective document, Fiscal
year 1975 --- composite materials, heat
resistant alloys, thermal insulation, protective
coatings
[AD-A005386] N75-28961

PYLONS

The effect of a pylon-mounted nacelle on the
flutter behaviour of a wing-pylon-nacelle
configuration
[NLR-TR-74125-U] N75-29056

PYRAMIDAL BODIES

Calculation of supersonic inviscid flow about a
pyramidal-body model of a delta-shaped vehicle
A75-40254

Q

QUALITY CONTROL
Preproduction evaluation of an improved titanium surface prebonding process
A75-40992

QUIET ENGINE PROGRAM
Preliminary design study of a quiet, high flow fan (QHF) stage --- turbopfans - quiet engine program [NASA-CR-134780] N75-29433

R

RADAR BEACONS
An analysis of aircraft L-band beacon antenna patterns [AD-A005569] N75-29287

RADAR BEAMS
Review of presently employed narrow-beam microwave antennas. II
A75-39268

RADONES
Investigation of reinforced plastics for naval aircraft electromagnetic (EM) windows [AD-A005170] N75-28243

RAIN IMPACT DAMAGE
Impact erosion - A serious environmental threat to aircraft and missiles [ASME PAPER 75-ENAS-45] A75-40860

RANDOM LOADS
Probabilistic design and structural fatigue --- aircraft applications. A75-39824

RANGE AND RANGE RATE TRACKING
Inertially aided ranging for guidance systems [AIAA PAPER 75-1109] A75-41671

RAREFIED GAS DYNAMICS
The structure of high-pressure jets of low density issuing from a supersonic nozzle
A75-39981

REAL TIME OPERATION
Application of real-time engine simulations to the development of propulsion system controls [NASA-TM-X-71764] N75-29108

RECEIVERS
Common antenna preamplifier-isolator for VLF-LF receivers [NASA-CR-143237] N75-28278

RECTANGULAR WIND TUNNELS
Higher order wind tunnel corrections for a two-dimensional circular arc lifting aerofoil in a closed rectangular wind tunnel [ARL/A-NOTE-349] N75-29034

RECTANGULAR WINGS
Calculation of the aerodynamic characteristics of a rectangular wing with end washers near a screen
A75-40931

REDUNDANCY
Digital flight control system redundancy study --- fly by wire control - aircraft guidance [AD-A006411] N75-29129

REFERENCE SYSTEMS
Design of an improved azimuth reference system [AIAA PAPER 75-1083] A75-41648

REINFORCED PLASTICS
Investigation of reinforced plastics for naval aircraft electromagnetic (EM) windows [AD-A005170] N75-28243

REINFORCING FIBERS
Fiber composite structures --- review
A75-38901

Forging of metal-matrix composites: Forging limit criteria and applications to process design
N75-28193

RELIABILITY ANALYSIS
Engine maintenance management program requires information [SAE PAPER 750613] A75-40520

Airborne electronics for automated flight systems
N75-29011

RELIEF VALVES
Evaluation by step response tests of prototype relief valves designed for YF-12 inlet stability bleed system [NASA-TM-X-3262] N75-29118

A throat-bypass stability system for a YF-12 aircraft research inlet using self-acting mechanical valves [NASA-TM-X-71779] N75-29128

REMOTE CONTROL
Automatic external load acquisition by helicopter [AD-A005051] N75-29097

RENOTELY PILOTED VEHICLES
Optimal design of a Mini-RPV lateral autopilot [AIAA PAPER 75-1121] A75-41682

Automatic control of drones and RPV's in formation [AIAA PAPER 75-1122] A75-41683

A design study for a remotely piloted vehicle, automatic landing system [AD-A005285] N75-28059

Full-scale aerodynamic and engine testing of the APL Symdel Mk 6 RPV [AD-A006283] N75-29099

RESEARCH AND DEVELOPMENT
Aircraft altitude emissions - Fundamental concepts and future R & D requirements [AIAA PAPER 75-1017] A75-39515

RESEARCH PROJECTS
General aviation's future need for research
N75-29021

RESONANT VIBRATION
'Snap-through' vibrations of the empennage --- wing or tail assembly flutter analysis
A75-40917

REYNOLDS NUMBER
Effects of Reynolds number and roughness on C sub Lmax --- aerodynamic characteristics of airfoil [NAL-TR-396] N75-29026

RIVETED JOINTS
A short study of the effect of a penetrant oil on the fatigue life of a riveted joint [ARC-CP-1305] N75-29483

ROLL
Edge forces and roll-rate derivatives
N75-28033

ROTARY WINGS
Introduction of unsteady separation into acceleration potential theory Application to the helicopter
A75-39331

The results of fabrication and testing of the prototype composite rotor blades for HLH and UTTAS --- Heavy Lift Helicopter and Utility Tactical Transport Aircraft System [AIAA PAPER 75-1010] A75-41694

Major Item Special Study (MISS), UH-1H main rotor hub assembly [AD-A005217] N75-28057

Cooperative program for design, fabrication, and testing of graphite-epoxy composite helicopter shafting [AD-A005024] N75-28244

The computation of aerodynamic loads on helicopter blades in forward flight, using the method of the acceleration potential [VTH-189] N75-29055

A computer program for helicopter rotor noise using Lovson's formula in the time domain [NASA-TM-X-72759] N75-29116

A simulation study of active feedback suppression of dynamic response in helicopter rotor blades [NASA-CR-132711] N75-29127

ROTATING DISKS
Disc failures - A cause for concern
A75-40532

ROTOR AERODYNAMICS
Introduction of unsteady separation into acceleration potential theory Application to the helicopter
A75-39331

S

SANDWICH STRUCTURES
Aerospace sandwich materials
A75-39351

SCALE MODELS
Simulation of large-scale dynamic systems
N75-29846

SCREWS
Shear and tension-bending fatigue test methods for threaded airframe fasteners [COM-75-10417/4] N75-28444

SEATS

Crashworthy helicopter gunner's seat investigation
[AD-A005563] N75-28054

SELF ADAPTIVE CONTROL SYSTEMS

A contribution to the design of digital
self-adaptive flight control systems --- German
book N75-41598

SEPARATED FLOW

Introduction of unsteady separation into
acceleration potential theory Application to the
helicopter N75-39331

SERVICE LIFE

Design of jet engine rotors for long life
[SAE PAPER 750619] A75-40524
Optimization of the time between aircraft
overhauls by minimizing maintenance cost
[AD-A006505] N75-29100

SHARP LEADING EDGES

Prediction of the steady aerodynamic loads of
lifting surfaces having sharp-edge separation
N75-28007

SHEAR STRESS

Characterization of 8-mil boron/aluminum material
--- tensile, shear and fatigue tests A75-40963

Shear and tension-bending fatigue test methods for
threaded airframe fasteners
[COM-75-10417/4] N75-28444

SHOCK LAYERS

Numerical computation of three-dimensional blunt
body flow fields with an impinging shock
[NASA-CR-143312] N75-29038

SHORT HAUL AIRCRAFT

Challenges of short-haul air transportation
[SAE PAPER 750586] A75-40501
Design of short haul aircraft for fuel conservation
[SAE PAPER 750587] A75-40502
Short haul transportation - The helicopter's time
is now

[SAE PAPER 750598] A75-40506
Airtransit's first six months of operating the
Canadian STOL demonstration service

[SAE PAPER 750599] A75-40508
Quiet clean short-haul experimental engine /QCSEE/
design rationale

[SAE PAPER 750605] A75-40513
An overview of low medium density short-haul air
transportation policy implementation

[SAE PAPER 750610] A75-40517
Optimum flight profiles for short haul missions
[AIAA PAPER 75-1124] A75-41684

SHORT TAKEOFF AIRCRAFT

Lateral-directional stability augmentation methods
for the STOL flight regime
[AIAA PAPER 75-1028] A75-39523

10 years of STOL - The Twin Otter's first decade
[SAE PAPER 750596] A75-40505
Airtransit's first six months of operating the
Canadian STOL demonstration service

[SAE PAPER 750599] A75-40508
Overview - Turbofan STOL transport aircraft
technology

[AIAA PAPER 75-300] A75-41179
Flight experience with time-of-arrival control for
STOL aircraft in the terminal area

[AIAA PAPER 75-1126] A75-41686
Aerodynamic design of the Boeing YC-14 advanced
medium STOL transport /AMST/

[AIAA PAPER 75-1015] A75-41696
Low-speed upwash interference on a transport model
in a rectangular slotted-wall wind tunnel

[NASA-TM-X-3218] N75-28026
Analytical investigation of medium STOL transport
structural concepts. Volume 1: Study results

[AD-A005818] N75-28060
Analytical investigation of medium STOL transport
structural concepts. Volume 2: Isograd
fuselage study

[AD-A006157] N75-28061
SIGNAL DETECTION

Reliable line signaling techniques for the FAA
GRN-27(V) and CAT-3 ILS
[AD-A009881] N75-29077

SIGNAL PROCESSING

The employment of Kalman filter technology for the
improvement of the signal quality of a microwave
beacon system A75-39090

SIKORSKY AIRCRAFT

Short haul transportation - The helicopter's time
is now
[SAE PAPER 750598] A75-40506

SIMULATION

Analytical simulation of the far-field jet noise
and the unsteady jet flow-field by a model of
periodic shedding of vortex ring from the jet exit
[NASA-CR-143211] N75-28021

SIZE DETERMINATION

Simultaneous calculation of aircraft design loads
and structural member sizes
[AIAA PAPER 75-965] A75-39491

SKIN (STRUCTURAL MEMBER)

Integrally stiffened graphite/epoxy construction
--- for wingboxes A75-40960

SLENDER BODIES

Solution of the inverse problem of the hypersonic
gas flow past a slender blunted body A75-40912

SLENDER WINGS

The dynamic stability derivatives of a slender
wing at zero and moderate life. A comparison of
theory with free-flight model tests, Mach number
equals 0.8 to 2.0

[ARC-CP-1310] N75-29048
A lifting surface theory method for treating swept
or slender wings in attached subsonic flow

[ARC-R/M-3760] N75-29053

SLOTTED WIND TUNNELS

Low-speed upwash interference on a transport model
in a rectangular slotted-wall wind tunnel
[NASA-TM-X-3218] N75-28026

SMALL PERTURBATION FLOW

Second-order small-perturbation theory for finite
wings in incompressible flow --- two dimensional
swept wings

[ARC-R/M-3759] N75-29052

SONIC BOOMS

Establishing certification/design criteria for
advanced supersonic aircraft utilizing
acceptance, interference, and annoyance response
to simulated sonic booms by persons in their homes

[AD-A009656] N75-29090

Survey of sonic boom phenomena for the
non-specialist --- sound wave propagation
[AD-A009663] N75-29113

SOUND PROPAGATION

Survey of sonic boom phenomena for the
non-specialist --- sound wave propagation
[AD-A009663] N75-29113

SOUND WAVES

Acoustic radiation from lined, unflanged ducts:
Acoustic source distribution program
[NASA-CR-120849] N75-28849

Acoustic radiation from lined unflanged ducts:
Directivity index program
[NASA-CR-120850] N75-28850

Acoustic radiation from lined, unflanged ducts:
Duct termination impedance program
[NASA-CR-120851] N75-28851

SPACE SHUTTLE ORBITERS

747 air carriage of the Space Shuttle Orbiter
A75-40602

SPACECRAFT CONTROL

Flight control and the effectiveness of an
aviation system
[NASA-TT-F-16262] N75-29126

SPACECRAFT DESIGN

On an airplane in outer space --- technology
transfer between aircraft design and spacecraft
design

[NASA-TT-F-16423] N75-29087

SPACECRAFT STRUCTURES

Recent NASA progress in composites --- application
to spacecraft and aircraft structures
[NASA-TM-X-72713] N75-29188

SPEED REGULATORS

Miniaturized high speed controls for turbine
engines fabrication and test
[AD-A006108] N75-29125

SUBJECT INDEX

SUPERSONIC AIRCRAFT

SPHERICAL SHELLS		
Impact of a flight vehicle on a spherical shell		
--- German book		
	A75-39223	
SPOT WELDS		
Weldbonding of aluminum aircraft structures		
	A75-40985	
STABILITY DERIVATIVES		
Determination of aerodynamic coupling derivatives through flight test		
[AIAA PAPER 75-1119]	A75-41680	
The dynamic stability derivatives of a slender wing at zero and moderate life. A comparison of theory with free-flight model tests, Mach number equals 0.8 to 2.0		
[ARC-CP-1310]	N75-29048	
Theoretical prediction of airplane stability derivatives at subcritical speeds		
[NASA-CR-132681]	N75-29089	
STABILIZED PLATFORMS		
Gyroscopes /2nd revised and enlarged edition/ --- Russian book		
	A75-40194	
STABILIZERS (FLUID DYNAMICS)		
Effect of vertical-tail location on the aerodynamic characteristics at subsonic speeds of a close-coupled canard configuration		
[NASA-TN-D-7947]	N75-28027	
STATE VECTORS		
Integrated flight/propulsion control by state regulation		
[AIAA PAPER 75-1075]	A75-41641	
STATIC LOADS		
The C-5A active load alleviation system		
[AIAA PAPER 75-991]	A75-39504	
Static fatigue behavior of cellulose and polyamide materials --- helicopter external load slings		
	A75-40967	
STATIC TESTS		
Noise reduction of EBF propulsive-lift systems --- Externally Blown Flaps		
[SAE PAPER 750608]	A75-40515	
STATISTICAL ANALYSIS		
Civil aviation midair collisions analysis: 1972 added to 1964 - 1971 results --- statistical analysis		
[AD-A005897]	N75-29064	
STIFFNESS MATRIX		
Influence of rigidity and damping in an elevator control system on the longitudinal stability of an aircraft and on elevator vibrations		
	A75-39340	
STORAGE STABILITY		
Desert storage test program		
[AD-A006103]	N75-29454	
STRATOSPHERE		
Aircraft investigations of the microstructure of the temperature fields in the troposphere and stratosphere		
[BLL-M-23558-(5828.4P)]	N75-28585	
STRESS ANALYSIS		
The effect of mean stress on the fatigue of aluminum alloys --- notched specimens		
[S/T-MEMO-9/74]	N75-29482	
STRESS CYCLES		
Structure interpretation by consideration of vibration resistance in light construction		
	A75-39402	
STRUCTURAL ANALYSIS		
Weapon system costing methodology for aircraft airframes and basic structures. Volume 2: Supporting design synthesis programs		
[AD-A005426]	N75-28051	
STRUCTURAL DESIGN		
Design study of structural concepts for an arrow-wing supersonic-cruise aircraft		
[AIAA PAPER 75-1037]	A75-39529	
Application of an advanced computerized structural design system to an arrow-wing supersonic cruise aircraft		
[AIAA PAPER 75-1038]	A75-39530	
Thermostructural and material considerations in the design of the F-14 aircraft transparencies		
[AIAA PAPER 75-990]	A75-41691	
STRUCTURAL DESIGN CRITERIA		
Analytical design of a monolithic wing		
	A75-40903	
PABST - A technology demonstrator --- Primary Adhesively Bonded Structure for aircraft		
[AIAA PAPER 75-989]	A75-41690	
Some trends in aircraft design: Structures		
	N75-29014	
STRUCTURAL ENGINEERING		
Aerospace sandwich materials		
	A75-39351	
Analytical investigation of medium STOL transport structural concepts. Volume 1: Study results		
[AD-A005818]	N75-28060	
Analytical investigation of medium STOL transport structural concepts. Volume 2: Isograd fuselage study		
[AD-A006157]	N75-28061	
NASA/University Conference on Aeronautics		
[NASA-SP-372]	N75-29001	
STRUCTURAL FAILURE		
Probabilistic design and structural fatigue --- aircraft applications		
	A75-39824	
STRUCTURAL MEMBERS		
Simultaneous calculation of aircraft design loads and structural member sizes		
[AIAA PAPER 75-965]	A75-39491	
Fail-safe/safe-life interface criteria		
[AD-A006131]	N75-29462	
STRUCTURAL VIBRATION		
Vibration tests of a structure with dry friction		
	A75-39330	
Structure interpretation by consideration of vibration resistance in light construction		
	A75-39402	
STRUCTURAL WEIGHT		
Divergence elimination with advanced composites --- for swept forward airfoils		
[AIAA PAPER 75-1009]	A75-39511	
SUBCRITICAL FLOW		
Theoretical prediction of airplane stability derivatives at subcritical speeds		
[NASA-CR-132681]	N75-29089	
SUBSONIC AIRCRAFT		
Advanced subsonic aircraft concepts for passenger transportation		
	A75-39023	
SUBSONIC FLOW		
Calculation of aerodynamic loads on oscillating wing/store combinations in subsonic flow		
	N75-28015	
Analysis of measured aerodynamic loads on an oscillating wing-store combination in subsonic flow		
	N75-28016	
On the application of subsonic linearised wing theory to second-order forces and moments		
[ARC-R/M-3758]	N75-28031	
General principles and mathematical models		
	N75-28032	
Edge forces and roll-rate derivatives		
	N75-28033	
A lifting surface theory method for treating swept or slender wings in attached subsonic flow		
[ARC-R/M-3760]	N75-29053	
SUBSONIC SPEED		
Pressure distributions on a cambered wing body configuration at subsonic Mach numbers		
[NASA-TN-D-7946]	N75-28029	
SUPERCritical FLOW		
Analytic investigation of transonic normal shock boundary layer interaction		
[AD-A004980]	N75-28041	
SUPERCritical WINGS		
The Spanloader advanced transport concept		
[SAE PAPER 750616]	A75-40518	
Opportunities for aerodynamic-drag reduction		
	N75-29016	
SUPERSONIC AIRCRAFT		
Design study of structural concepts for an arrow-wing supersonic-cruise aircraft		
[AIAA PAPER 75-1037]	A75-39529	
Application of an advanced computerized structural design system to an arrow-wing supersonic cruise aircraft		
[AIAA PAPER 75-1038]	A75-39530	
The NASA research program on propulsion for supersonic cruise aircraft		
[SAE PAPER 750629]	A75-40531	

Aircraft investigations of the microstructure of the temperature fields in the troposphere and stratosphere
[BLL-M-23558-(5828.4P)] N75-28585

SUPERSONIC COMBUSTION RAMJET ENGINES

Joint USAF/NASA hypersonic research aircraft study
[AIAA PAPER 75-1039] A75-39531

An improved numerical procedure for the parametric optimization of three dimensional scramjet nozzles --- supersonic combustion ramjet engines - computer programs
[NASA-CR-132695] N75-29359

An improved source flow characteristic technique for the analysis of scramjet exhaust flow fields
[NASA-CR-132697] N75-29361

SUPERSONIC DRAG

Techniques for determining propulsion system forces for accurate high speed vehicle drag measurements in flight
[AIAA PAPER 75-964] A75-41689

SUPERSONIC FLOW

A theory for the calculation of conical paraboloids with weak camber in supersonic flow --- German book
A75-39224

Downwash during supersonic flow about a plate
A75-39857

Calculation of supersonic inviscid flow about a pyramidal-body model of a delta-shaped vehicle
A75-40254

Noise suppression with high Mach number inlets
[NASA-CR-143314] N75-29115

Measurements at the leeward side of a cone at large incidences in supersonic flow
[VTI-186] N75-29370

SUPERSONIC INLETS

Evaluation by step response tests of prototype relief valves designed for YF-12 inlet stability bleed system
[NASA-TN-X-3262] N75-29118

SUPERSONIC JET FLOW

The structure of high-pressure jets of low density issuing from a supersonic nozzle
A75-39981

SUPERSONIC TRANSPORTS

Advanced supersonic transport
[SAE PAPER 750617] A75-40522

Engine design considerations for 2nd generation supersonic transports
[SAE PAPER 750628] A75-40530

SURFACE PROPERTIES

Mathematical description of a wing surface
A75-40910

SURFACE ROUGHNESS EFFECTS

The effect of the surface roughness of blade profiles on the flow characteristics of a turbine --- German book
A75-39220

SWEEP FORWARD WINGS

Divergence elimination with advanced composites --- for swept forward airfoils
[AIAA PAPER 75-1009] A75-39511

SWEEP WINGS

Augmentation of vortex lift by spanwise blowing --- wind tunnel testing for swept wing fighter aircraft
[AIAA PAPER 75-993] A75-39505

Measurements in an incompressible three-dimensional turbulent boundary layer, under infinite swept-wing conditions, and comparison with theory
A75-40206

The Spanloader advanced transport concept
[SAE PAPER 750616] A75-40518

Approximate method for calculating the aerodynamic characteristics of semicircular wings with a constant sweep span
A75-40918

Measurement and analysis of unsteady aerodynamic force for the vertical gust on an airplane model in the NAL gust wind tunnel --- swept wing interference tests
[NAL-TR-399] N75-29027

The prediction of boundary-layer behavior and profile drag for infinite yawed wings. Part 2: Flow near a turbulent attachment line
[ARC-CP-1308] N75-29043

The prediction of boundary-layer behaviour and profile drag for infinite yawed wings. Part 3: Calculations for a particular wing
[ARC-CP-1309-PT-3] N75-29047

Second-order small-perturbation theory for finite wings in incompressible flow --- two dimensional swept wings
[ARC-R/M-3759] N75-29052

A lifting surface theory method for treating swept or slender wings in attached subsonic flow
[ARC-R/M-3760] N75-29053

The effect of a pylon-mounted nacelle on the flutter behaviour of a wing-pylon-nacelle configuration
[NLR-TR-74125-U] N75-29056

SYSTEMS ANALYSIS

P-15 flight flutter testing - Aircraft systems and test operations
[AIAA PAPER 75-1031] A75-39526

SYSTEMS COMPATIBILITY

Performance compatibility and flight testing of B-52 CCV systems
[AIAA PAPER 75-1035] A75-39528

SYSTEMS ENGINEERING

Holographic horizontal display system
A75-41405

Design of an improved azimuth reference system
[AIAA PAPER 75-1083] A75-41648

Balanced functional design of automatic digital flight control systems
[AIAA PAPER 75-1088] A75-41653

T

T TAIL SURFACES

The Spanloader advanced transport concept
[SAE PAPER 750616] A75-40518

T-33 AIRCRAFT

In-flight simulation of the light weight fighters
[AIAA PAPER 75-985] A75-39500

TACAN

TACAN and ILS station evaluation report, Loring AFB, Maine
[AD-A006416] N75-29084

TAIL ASSEMBLIES

'Snap-through' vibrations of the empennage --- wing or tail assembly flutter analysis
A75-40917

Pan-in-fuselage advanced antitorque system
[AD-A005049] N75-28055

A technique for analysing the results of a flutter calculation --- exemplified for tail assembly with two degrees of freedom
[ARC-R/M-3765] N75-29054

TAIL SURFACES

On the response of an airplane to sinusoidal gust
A75-41474

TAILLESS AIRCRAFT

Longitudinal motions of aircraft involving high angles of attack
[ARC-R/M-3753] N75-29094

TAKEOFF RUNS

Air cushion take-off and landing systems for aircraft
A75-41798

TANDEM ROTOR HELICOPTERS

Flight simulation of the model 347 advanced tandem-rotor helicopter
[AD-A005050] N75-28052

TANKER AIRCRAFT

Design of aircraft fuel systems --- Russian book
A75-40198

TARGET DRONE AIRCRAFT

Automatic control of drones and RPV's in formation
[AIAA PAPER 75-1122] A75-41683

TECHNOLOGICAL FORECASTING

The airship debate --- revival feasibility
A75-39321

Future hydrogen fueled commercial transports
[SAE PAPER 750615] A75-40521

Future lighter-than-air concepts
[SAE PAPER 750618] A75-40523

TECHNOLOGY ASSESSMENT

Fiber composite structures --- review
A75-38901

The challenge to advanced cargo aircraft systems
A75-39019

SUBJECT INDEX

TRANSONIC FLOW

- Jet aircraft emissions during cruise - Present and future
[AIAA PAPER 75-1018] A75-39516
- Is there an airship in your future A75-39923
- Whither all weather - An airplane manufacturer's point of view --- all weather landing systems
[SAE PAPER 750601] A75-40510
- An overview of low medium density short-haul air transportation policy implementation
[SAE PAPER 750610] A75-40517
- Overview - Turbofan STOL transport aircraft technology
[AIAA PAPER 75-300] A75-41179
- PCAP - A new tool for the evaluation of active control technology --- Flight Control Analysis Program for flexible aircraft
[AIAA PAPER 75-1059] A75-41630
- Air safety - The view from the cockpit A75-41703
- TECHNOLOGY TRANSFER**
On an airplane in outer space --- technology transfer between aircraft design and spacecraft design
[NASA-TT-F-16423] N75-29087
- TECHNOLOGY UTILIZATION**
Short haul transportation - The helicopter's time is now
[SAE PAPER 750598] A75-40506
- Application of active controls technology to the NASA Jet Star airplane
[NASA-CR-2561] N75-28049
- TEMPERATURE CONTROL**
A fluidically controlled aircraft environmental system
[ASME PAPER 75-PN-AS-7] A75-40894
- TEMPERATURE DISTRIBUTION**
Aircraft investigations of the microstructure of the temperature fields in the troposphere and stratosphere
[BLM-M-23558-(5828.4F)] N75-28585
- TENSILE STRESS**
Characterization of 8-mil boron/aluminum material --- tensile, shear and fatigue tests A75-40963
- Shear and tension-bending fatigue test methods for threaded airframe fasteners
[COM-75-10417/4] N75-28444
- TERMINAL GUIDANCE**
Time-controlled descent guidance in uncertain winds
[AIAA PAPER 75-1078] A75-41644
- TERMINOLOGY**
Proposed MIL-STD-XXX aircraft nonnuclear survivability/vulnerability terms
[AD-A004972] N75-28056
- TERRAIN FOLLOWING AIRCRAFT**
Development of automatic terrain-following/automatic terrain-avoidance decoupling techniques
[AIAA PAPER 75-1074] A75-41640
- TEST EQUIPMENT**
Intermittent positive control computer algorithm for test bed experiments --- collision avoidance - aircraft guidance
[AD-A009215] N75-29068
- THERMAL INSULATION**
Air Force technical objective document, Fiscal year 1975 --- composite materials, heat resistant alloys, thermal insulation, protective coatings
[AD-A005386] N75-28961
- THERMAL STABILITY**
Processable high temperature resistant polymer matrix materials A75-39482
- PMR polyimides - Processable high temperature composite matrix resins A75-40999
- THERMAL STRESSES**
Thermostructural and material considerations in the design of the F-14 aircraft transparencies
[AIAA PAPER 75-990] A75-41691
- THICKNESS RATIO**
Calculation of unsteady transonic aerodynamics for oscillating wings with thickness
[NASA-CR-2259] N75-28030
- Theoretical effect of modifications to the upper surface of two NACA airfoils using smooth polynomial additional thickness distributions which emphasize leading edge profile and which vary linearly at the trailing edge
[NASA-CR-137717] N75-29030
- THIN AIRFOILS**
Parabolic method for solving the problem of a sonic gas flow about a thin symmetric profile A75-40259
- THIN WINGS**
Approximate method for calculating the aerodynamic characteristics of semicircular wings with a constant sweep span A75-40918
- Calculation of the aerodynamic characteristics of a rectangular wing with end washers near a screen A75-40931
- On the response of an airplane to sinusoidal gust A75-41474
- THREE DIMENSIONAL BOUNDARY LAYER**
Measurements in an incompressible three-dimensional turbulent boundary layer, under infinite swept-wing conditions, and comparison with theory A75-40206
- THRUST REVERSAL**
Wind tunnel test of model target thrust reversers for the Pratt and Whitney aircraft JT8D-100 series engines installed on a 727-200 airplane
[NASA-CR-134709] N75-29117
- TILT WING AIRCRAFT**
The influence of engine/transmission/governor on tilting propeller aircraft dynamics
[NASA-TN-X-62455] N75-28050
- TIME OPTIMAL CONTROL**
Time-controlled descent guidance in uncertain winds
[AIAA PAPER 75-1078] A75-41644
- TITANIUM**
Preproduction evaluation of an improved titanium surface prebonding process A75-40992
- TOPOGRAPHY**
COMED - A combined display including a full electronic facility and a topographical moving map display --- Combined Map and Electronic Display for fighter aircraft A75-41404
- TRAILING EDGES**
Downwash during supersonic flow about a plate A75-39857
- TRAINING SIMULATORS**
Parallelism in commercial and military use of simulation
[AIAA PAPER 75-971] A75-39496
- TRAJECTORIES**
Extension of the method for predicting six-degree-of-freedom store separation trajectories at speeds up to the critical speed to include a fuselage with noncircular cross section. Volume 1: Theoretical methods and comparisons with experiment --- external stores - attack aircraft
[AD-A005822] N75-29071
- TRAJECTORY OPTIMIZATION**
Optimum flight profiles for short haul missions
[AIAA PAPER 75-1124] A75-41684
- TRANSFER OF TRAINING**
Parallelism in commercial and military use of simulation
[AIAA PAPER 75-971] A75-39496
- TRANSFORMATIONS (MATHEMATICS)**
Effects of sampling rate and transformation techniques on the design of digital notch filters --- for aircraft flight control systems design
[AIAA PAPER 75-1084] A75-41649
- TRANSMISSION EFFICIENCY**
The influence of engine/transmission/governor on tilting propeller aircraft dynamics
[NASA-TN-X-62455] N75-28050
- TRANSONIC FLIGHT**
Estimation of transonic aircraft aerodynamics to high angles of attack
[AIAA PAPER 75-996] A75-39508
- TRANSONIC FLOW**
Parabolic method for solving the problem of a sonic gas flow about a thin symmetric profile A75-40259

TRANSONIC WIND TUNNELS

SUBJECT INDEX

- Calculation of unsteady transonic aerodynamics for oscillating wings with thickness
[NASA-CR-2259] N75-28030
- Analytic investigation of transonic normal shock boundary layer interaction
[AD-A004980] N75-28041
- TRANSONIC WIND TUNNELS**
- The role of the NAE 5x5 foot wind tunnel in the development of modern airfoil sections
A75-39022
- Transonic wind tunnel investigation of thrust effects on the longitudinal stability characteristics of several body-fin configurations (sting-mounted model with normal-jet plume simulator)
[AD-A005152] N75-28042
- User's guide for a revised computer program to analyze the LRC 16 foot transonic dynamics tunnel active cable mount system --- computer techniques - aircraft models
[NASA-CR-132692] N75-29130
- TRANSPARENCY**
- Thermostructural and material considerations in the design of the F-14 aircraft transparencies
[AIAA PAPER 75-990] A75-41691
- TRANSPORT AIRCRAFT**
- 10 years of STOL - The Twin Otter's first decade
[SAE PAPER 750596] A75-40505
- The Spanloader advanced transport concept
[SAE PAPER 750616] A75-40518
- Future hydrogen fueled commercial transports
[SAE PAPER 750615] A75-40521
- Overview - Turbofan STOL transport aircraft technology
[AIAA PAPER 75-300] A75-41179
- Fuel conservation possibilities for terminal area compatible transport aircraft
[AIAA PAPER 75-1036] A75-41698
- Conceptual design study of 1985 commercial VTOL transports that utilize rotors
[NASA-CR-25321] N75-28043
- Conceptual engineering design studies of 1985-era commercial VTOL and STOL transports that utilize rotors
[NASA-CR-2545] N75-28044
- Vibrations measured in the passenger cabins of two jet transport aircraft
[NASA-TN-D-7923] N75-29037
- Baseline measurement of the noise generated by a short-to-medium range jet transport flying standard ILS approaches and level flyovers
[NASA-TM-X-72760] N75-29119
- TROPOSPHERE**
- Aircraft investigations of the microstructure of the temperature fields in the troposphere and stratosphere
[BLL-M-23558-(5828.4P)] N75-28585
- TURBINE BLADES**
- The effect of the surface roughness of blade profiles on the flow characteristics of a turbine --- German book
A75-39220
- Metal matrix composites for aircraft propulsion systems
A75-39483
- Calculation of aircraft engine turbines. (Gasdynamic calculation: Blade profiling)
[NASA-TT-P-16367] N75-29120
- The impact between a liquid drop and an elastic half-space
[PB-241155/1] N75-29378
- TURBINE WHEELS**
- Design of jet engine rotors for long life
[SAE PAPER 750619] A75-40524
- TURBOCOMPRESSORS**
- Small gas turbine auxiliary power units
[ASME PAPER 75-ENAS-1] A75-40896
- TURBOFAN ENGINES**
- F-15 propulsion flight testing experience
[AIAA PAPER 75-1052] A75-39539
- NASA refan program status
[SAE PAPER 750592] A75-40507
- Overview - Turbofan STOL transport aircraft technology
[AIAA PAPER 75-300] A75-41179
- DC-9 flight testing of the refanned JT8D engine
[AIAA PAPER 75-998] A75-41693
- Thrust/drag analysis for a front fan nacelle having two separate co-axial exhaust streams --- for turbofan engines
[ARC-CP-1311] N75-29049
- Application of real-time engine simulations to the development of propulsion system controls
[NASA-TM-X-71764] N75-29108
- Wind tunnel test of model target thrust reversers for the Pratt and Whitney aircraft JT8D-100 series engines installed on a 727-200 airplane
[NASA-CR-134709] N75-29117
- TURBOFANS**
- Preliminary design study of a quiet, high flow fan (QHF) stage --- turbofans - quiet engine program
[NASA-CR-134780] N75-29433
- TURBOJET ENGINES**
- Application of real-time engine simulations to the development of propulsion system controls
[NASA-TM-X-71764] N75-29108
- TURBULENCE EFFECTS**
- Effort of spanwise variation of turbulence on the normal acceleration of airplanes with small span relative to turbulence scale
[NASA-TM-X-72748] N75-29036
- A direct time history study of the response of an airplane to nonstationary turbulence
[AD-A006159] N75-29102
- TURBULENCE BOUNDARY LAYER**
- Measurements in an incompressible three-dimensional turbulent boundary layer, under infinite swept-wing conditions, and comparison with theory
A75-40206
- Analytic investigation of transonic normal shock boundary layer interaction
[AD-A004980] N75-28041
- The prediction of boundary-layer behavior and profile drag for infinite yawed wings. Part 2: Flow near a turbulent attachment line
[ARC-CP-1308] N75-29043
- The prediction of boundary-layer behaviour and profile drag for infinite yawed wings. Part 1: A method of calculation
[ARC-CP-1307-PT-1] N75-29046
- The prediction of boundary-layer behaviour and profile drag for infinite yawed wings. Part 3: Calculations for a particular wing
[ARC-CP-1309-PT-3] N75-29047
- TURBULENCE JETS**
- Numerical simulation of turbulent jet noise, part 1
[NASA-CR-132693] N75-28069
- TURBULENCE WAKES**
- On wake vortex alleviation
N75-29010
- Vortex-related accidents over the ten year period 1964 - 1973
[AD-A010111] N75-29065
- TWO DIMENSIONAL BODIES**
- Transonic data memorandum: Second-order method for estimating the subcritical pressure distribution on a two-dimensional aerofoil in compressible inviscid flow
[ESDU-72025] N75-29029
- Second-order small-perturbation theory for finite wings in incompressible flow --- two dimensional swept wings
[ARC-R/M-3759] N75-29052
- U**
- UH-1 HELICOPTER**
- Major Item Special Study (MISS), UH-1H main rotor hub assembly
[AD-A005217] N75-28057
- Major Item Special Study (MISS), UH-1H 90 degrees T/R gear box --- value engineering - UH-1 helicopter
[AD-A006506] N75-29098
- ULTRAHIGH FREQUENCIES**
- An analysis of aircraft L-band beacon antenna patterns
[AD-A005569] N75-29287
- UNIVERSITIES**
- General aviation's future need for research
N75-29021

UNSTEADY FLOW

- Introduction of unsteady separation into acceleration potential theory Application to the helicopter A75-39331
- Analytical simulation of the far-field jet noise and the unsteady jet flow-field by a model of periodic shedding of vortex ring from the jet exit [NASA-CR-143211] N75-28021
- Calculation of unsteady transonic aerodynamics for oscillating wings with thickness [NASA-CR-2259] N75-28030

UNSWEEP WINGS

- Effort of spanwise variation of turbulence on the normal acceleration of airplanes with small span relative to turbulence scale [NASA-TN-X-72748] N75-29036

UPWASH

- Low-speed upwash interference on a transport model in a rectangular slotted-wall wind tunnel [NASA-TN-X-3218] N75-28026

URBAN PLANNING

- Application of the helicopter KA-26 to large-scale aerial photography [AD-A005950] N75-29393

URBAN TRANSPORTATION

- Short haul transportation - The helicopter's time is now [SAE PAPER 750598] A75-40506

USER MANUALS (COMPUTER PROGRAMS)

- User's guide for a revised computer program to analyze the LRC 16 foot transonic dynamics tunnel active cable mount system --- computer techniques - aircraft models [NASA-CR-132692] N75-29130

V**V/STOL AIRCRAFT**

- High-performance jet-V/STOL development [AIAA PAPER 75-1013] A75-39513
- Analysis of response requirements for V/STOL lift/cruise engines used to provide height and moment control [AIAA PAPER 75-1014] A75-39514
- The use of in-flight simulation to develop control system and display requirements for conventional and V/STOL airplanes A75-41415
- Design of a V/STOL technology airplane [AIAA PAPER 75-1012] A75-41695
- Potential and viscous flow prediction in V/STOL propulsion system inlets [NASA-TN-X-71776] N75-29110
- Digital simulation of V/STOL aircraft for autopilot research N75-29853

VALUE ENGINEERING

- Major Item Special Study (MISS), UH-1H 90 degrees T/R gear box --- value engineering - UH-1 helicopter [AD-A006506] N75-29098

VARIABLE SWEEP WINGS

- MRCA flight flutter testing [AIAA PAPER 75-1033] A75-39527
- Wing with stores flutter on variable sweep wing aircraft N75-28017

VARIABLE THRUST

- Differential thrust equations for a transient mode of engine operation A75-40922

VEHICLE WHEELS

- Operational reliability of aircraft wheels --- Russian book A75-40174

VELOCITY ERRORS

- The use of autocorrelation functions to predict the effects of vertical deflections on aircraft navigation [AIAA PAPER 75-1101] A75-41663

VERTICAL AIR CURRENTS

- Device for determining the location of the maximum climb rate of an ascending air current --- for glider flight applications A75-41100

VERTICAL TAKEOFF AIRCRAFT

- Conceptual design study of 1985 commercial VTOL transports that utilize rotors [NASA-CR-2532] N75-28043
- Conceptual engineering design studies of 1985-era commercial VTOL and STOL transports that utilize rotors [NASA-CR-2545] N75-28044
- Summary of model VTOL lift fan tests conducted at NASA Lewis Research Center [NASA-TN-X-71778] N75-29106

VERY LOW FREQUENCIES

- Common antenna preamplifier-isolator for VLF-LF receivers [NASA-CR-143237] N75-28278

VIBRATION DAMPING

- Influence of rigidity and damping in an elevator control system on the longitudinal stability of an aircraft and on elevator vibrations A75-39340
- P-15 flight flutter testing - Aircraft systems and test operations [AIAA PAPER 75-1031] A75-39526

VIBRATION MEASUREMENT

- Vibrations measured in the passenger cabins of two jet transport aircraft [NASA-TN-D-7923] N75-29037

VIBRATION TESTS

- Vibration tests of a structure with dry friction A75-39330
- Fatigue damage equivalence of field and simulated vibrational environments [AD-A006226] N75-29453

VIBRATIONAL STRESS

- Structure interpretation by consideration of vibration resistance in light construction A75-39402

VISCOUS DRAG

- Numerical investigation of the flow of a viscous, heat-conducting gas past a blunt body with finite dimensions A75-40255

VISCOUS FLOW

- Potential and viscous flow prediction in V/STOL propulsion system inlets [NASA-TN-X-71776] N75-29110

VISIBILITY

- Analysis of visibility conditions for aircraft landing in radiation fog [BLL-M-23561-(5828.4P)] N75-28632

VORTEX BREAKDOWN

- The effect of wing dihedral and section suction distribution on vortex bursting [NASA-TN-X-72745] N75-29091

VORTEX RINGS

- Analytical simulation of the far-field jet noise and the unsteady jet flow-field by a model of periodic shedding of vortex ring from the jet exit [NASA-CR-143211] N75-28021

VORTICES

- Augmentation of vortex lift by spanwise blowing --- wind tunnel testing for swept wing fighter aircraft [AIAA PAPER 75-993] A75-39505
- Vortex method for calculating a wing profile of arbitrary shape A75-40913
- Calculation of the aerodynamic characteristics of a rectangular wing with end washers near a screen A75-40931
- Vortex wake behind a helicopter [AD-A005479] N75-28038
- Laser Doppler velocimeter system simulation for sensing aircraft wake vortices. Part 2: Processing and analysis of LDV data (for runs 1023 and 2023) [NASA-CR-120758] N75-28394
- Laser Doppler velocimeter system simulation for sensing aircraft wake vortices. Part 3: The problem of reflection from the secondary mirror [NASA-CR-120759] N75-28395
- On wake vortex alleviation N75-29010
- Unsteady vortex lattice techniques applied to wake formation and performance of the statically thrusting propeller [NASA-CR-132686] N75-29031

VULNERABILITY

SUBJECT INDEX

Vortex-related accidents over the ten year period
1964 - 1973
[AD-A010111] N75-29065

VULNERABILITY
Proposed MIL-STD-XXX aircraft nonnuclear
survivability/vulnerability terms
[AD-A004972] N75-28056

W

WARFARE
Application of differential game theory to
role-determination in aerial combat
[NASA-CR-137713] N75-28822

WARNING SYSTEMS
Results of an aircraft visibility questionnaire
concerned with the estimated benefits of
airborne proximity warning indicator systems
[AD-A009884] N75-29061

WASHERS (SPACERS)
Calculation of the aerodynamic characteristics of
a rectangular wing with end washers near a screen
A75-40931

WATERPROOFING
Evaluation of experimental polyurethane-coated
membranes
[AD-A005151] N75-28236

WAVE PROPAGATION
Survey of sonic boom phenomena for the
non-specialist --- sound wave propagation
[AD-A009663] N75-29113

WEAPON SYSTEMS
Aircraft optimal weapon delivery maneuvers based
on extended energy management --- air-to-air
missile launching
[AIAA PAPER 75-1076] A75-41642
Weapon system costing methodology for aircraft
airframes and basic structures. Volume 2:
Supporting design synthesis programs
[AD-A005426] N75-28051
A GASP 4 simulation of tactical air interdiction
using a choice of weapons loads and continuously
changing weather conditions
[AD-A006349] N75-29417

WEIGHT REDUCTION
Composites technology - Threshold to low cost
aircraft structures
[AIAA PAPER 75-1006] A75-39509

WELDED JOINTS
Weldbonding of aluminum aircraft structures
A75-40985

WIND PRESSURE
Wind tunnel generation of sinusoidal lateral and
longitudinal gusts by circulation of twin
parallel airfoils
[NASA-CR-137547] N75-29351

WIND PROFILES
Time-controlled descent guidance in uncertain winds
[AIAA PAPER 75-1078] A75-41644

WIND TUNNEL APPARATUS
Wind tunnel generation of sinusoidal lateral and
longitudinal gusts by circulation of twin
parallel airfoils
[NASA-CR-137547] N75-29351

WIND TUNNEL TESTS
The role of the NAE 5x5 foot wind tunnel in the
development of modern airfoil sections
A75-39022
The experimental cascade performance of NACA
compressor profiles at low Reynolds number
A75-39350
Augmentation of vortex lift by spanwise blowing
--- wind tunnel testing for swept wing fighter
aircraft
[AIAA PAPER 75-993] A75-39505
A large-scale low-speed tunnel test of a canard
configuration with spanwise blowing
[AIAA PAPER 75-994] A75-39506
Measurements in an incompressible
three-dimensional turbulent boundary layer,
under infinite swept-wing conditions, and
comparison with theory
A75-40206
Transonic wind tunnel investigation of thrust
effects on the longitudinal stability
characteristics of several body-fin
configurations (sting-mounted model with
normal-jet plume simulator)
[AD-A005152] N75-28042

Icing tunnel test: Hot-film anemometer
[AD-A005044] N75-28404
Full-scale aerodynamic and engine testing of the
APL Syndel Mk 6 RPV
[AD-A006283] N75-29099
Summary of model VTOL lift fan tests conducted at
NASA Lewis Research Center
[NASA-TN-X-71778] N75-29106
Wind tunnel test of model target thrust reversers
for the Pratt and Whitney aircraft JT8D-100
series engines installed on a 727-200 airplane
[NASA-CR-134709] N75-29117
Experimentally determined aeroacoustic performance
and control of several sonic inlets
[NASA-TN-X-71767] N75-29353

WIND TUNNELS
Wind tunnel generation of sinusoidal lateral and
longitudinal gusts by circulation of twin
parallel airfoils
[NASA-CR-137547] N75-29351

WIND VELOCITY MEASUREMENT
Device for determining the location of the maximum
climb rate of an ascending air current --- for
glider flight applications
A75-41100
Wind modeling and lateral control for automatic
landing
[AIAA PAPER 75-1077] A75-41643

WING CAMBER
A theory for the calculation of conical
paragiders with weak camber in supersonic flow
--- German book
A75-39224

WING FLAPS
The jet flap wing in proximity to the ground,
giving particular attention to large angles of
attack and large jet-flap angles --- German book
A75-41233

WING LOADING
Impact of a flight vehicle on a spherical shell
--- German book
A75-39223
The C-5A active load alleviation system
[AIAA PAPER 75-991] A75-39504
Divergence elimination with advanced composites
--- for swept forward airfoils
[AIAA PAPER 75-1009] A75-39511
On the application of subsonic linearised wing
theory to second-order forces and moments
[ARC-R/H-3758] N75-28031
General principles and mathematical models
N75-28032
Edge forces and roll-rate derivatives
N75-28033
A lifting surface theory method for treating swept
or slender wings in attached subsonic flow
[ARC-R/H-3760] N75-29053

WING OSCILLATIONS
'Snap-through' vibrations of the empennage ---
wing or tail assembly flutter analysis
A75-40917

WING PANELS
Integrally stiffened graphite/epoxy construction
--- for wingboxes
A75-40960

WING PLANFORMS
Theory for calculating a wing of small aspect
ratio from a discrete-continuous calculation
scheme /matrix differential equation of axial
displacements/
A75-40905
Approximate method for calculating the aerodynamic
characteristics of semicircular wings with a
constant sweep span
A75-40918
Divergence elimination with advanced composites
--- wing planforms - aircraft design
N75-28137

WING PROFILES
Effects of wing bend on the aerodynamic
characteristics of a low aspect ratio oblique wing
[AIAA PAPER 75-995] A75-39507
Remarks on approximate conformal representation of
biplane wing sections
A75-40405
Mathematical description of a wing surface
A75-40910

- vortex method for calculating a wing profile of arbitrary shape A75-40913
- The prediction of boundary-layer behaviour and profile drag for infinite yawed wings. Part 1: A method of calculation [ARC-CP-1307-PT-1] N75-29046
- The prediction of boundary-layer behaviour and profile drag for infinite yawed wings. Part 3: Calculations for a particular wing [ARC-CP-1309-PT-3] N75-29047
- WING SPAN**
- A large-scale low-speed tunnel test of a canard configuration with spanwise blowing [AIAA PAPER 75-994] A75-39506
- The effect of wing dihedral and section suction distribution on vortex bursting [NASA-TM-X-72745] N75-29091
- WING TANKS**
- Analysis of measured aerodynamic loads on an oscillating wing-store combination in subsonic flow N75-28016
- WINGS**
- Analytical design of a monolithic wing A75-40903
- Specialists Meeting on Wing-with-Stores Flutter [AGARD-CP-162] N75-28011
- Calculation methods for the flutter of aircraft wings and external stores N75-28012
- Flutter of wings equipped with large engines in pod N75-28014
- Calculation of unsteady transonic aerodynamics for oscillating wings with thickness [NASA-CR-2259] N75-28030
- Shear and moment response of the airplane wing to nonstationary turbulence [NAL-TR-404T] N75-29032

X

- X-24 AIRCRAFT**
- Joint USAF/NASA hypersonic research aircraft study [AIAA PAPER 75-1039] A75-39531

Y

- YAW**
- The prediction of boundary-layer behavior and profile drag for infinite yawed wings. Part 2: Flow near a turbulent attachment line [ARC-CP-1308] N75-29043
- YAWING MOMENTS**
- On the application of subsonic linearised wing theory to second-order forces and moments [ARC-R/M-3758] N75-28031
- General principles and mathematical models N75-28032
- YC-14 AIRCRAFT**
- YC-14 flight control [AIAA PAPER 75-1027] A75-39522
- Installation effects on the CF6-50 in the YC-14 aircraft [SAE PAPER 750607] A75-40514
- YC-14 digital flight control data management [AIAA PAPER 75-1087] A75-41652
- Aerodynamic design of the Boeing YC-14 advanced medium STOL transport /AMST/ [AIAA PAPER 75-1015] A75-41696
- YP-12 AIRCRAFT**
- A throat-bypass stability system for a YP-12 aircraft research inlet using self-acting mechanical valves [NASA-TM-X-71779] N75-29128

Z

- ZERO LIFT**
- The dynamic stability derivatives of a slender wing at zero and moderate life. A comparison of theory with free-flight model tests, Mach number equals 0.8 to 2.0 [ARC-CP-1310] N75-29048

PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING /A Special Bibliography (Suppl 63)

NOVEMBER 1975

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g. NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g. N75-10945. Under any one author's name the accession numbers are arranged in sequence with the /AA accession numbers appearing first.

A

- ABDALLA, K. L.**
NASA refan program status
[SAE PAPER 750592] A75-40507
- ABRAMOVITZ, M.**
Lateral-directional stability augmentation methods for the STOL flight regime
[AIAA PAPER 75-1028] A75-39523
- ADACHI, H.**
On the design of a model reference adaptive flight control system
[AIAA PAPER 75-1111] A75-41673
- ADAMSON, A. P.**
Quiet clean short-haul experimental engine /QCSE/ design rationale
[SAE PAPER 750605] A75-40513
- ADKISSON, R. E.**
Analytical investigation of medium STOL transport structural concepts. Volume 1: Study results
[AD-A005818] N75-28060
Analytical investigation of medium STOL transport structural concepts. Volume 2: Isograd fuselage study
[AD-A006157] N75-28061
- ADLER, R. W.**
Induced currents on two dimensional electromagnetic planar structures
[AD-A005733] N75-29339
- AGGARWAL, R.**
Aircraft optimal weapon delivery maneuvers based on extended energy management
[AIAA PAPER 75-1076] A75-41642
- AIKEN, E. W.**
The use of in-flight simulation to develop control system and display requirements for conventional and V/STOL airplanes A75-41415
- AKLEY, C. R.**
Pan-in-fuselage advanced antitorque system
[AD-A005049] N75-28055
- ALPERIN, B. J.**
Analytical investigation of medium STOL transport structural concepts. Volume 2: Isograd fuselage study
[AD-A006157] N75-28061
- ALVAREZ, R. T.**
Kerimid 353 bis-maleimide laminating resin A75-40972
- ANDERSON, G. H.**
Aircraft optimal weapon delivery maneuvers based on extended energy management
[AIAA PAPER 75-1076] A75-41642

- ANDREYEVSKIY, V. V.**
Flight control and the effectiveness of an aviation system
[NASA-TT-F-16262] N75-29126
- ANNENKOV, N. P.**
The BSU-ZP onboard control system A75-40175
- ARNAIZ, H. H.**
Techniques for determining propulsion system forces for accurate high speed vehicle drag measurements in flight
[AIAA PAPER 75-964] A75-41689
- ASPIN, W. H.**
COMED - A combined display including a full electronic facility and a topographical moving map display A75-41404
- AUDI, M. S.**
Noise abatement by the interaction of cold coaxial model jets N75-28062
- AXELSON, J. A.**
Estimation of transonic aircraft aerodynamics to high angles of attack
[AIAA PAPER 75-996] A75-39508

B

- BABAKOV, A. V.**
Numerical investigation of the flow of a viscous, heat-conducting gas past a blunt body with finite dimensions A75-40255
- BAILEY, R. G.**
A GASP 4 simulation of tactical air interdiction using a choice of weapons loads and continuously changing weather conditions
[AD-A006349] N75-29417
- BAIRD, E. P.**
Recent observations on external-store flutter N75-28019
- BAKER, D. J.**
Cooperative program for design, fabrication, and testing of graphite-epoxy composite helicopter shafting
[AD-A005024] N75-28244
- BALDOCK, J. C. A.**
Calculation methods for the flutter of aircraft wings and external stores N75-28012
- A technique for analysing the results of a flutter calculation**
[ARC-R/M-3765] N75-29054
- BALJAEV, V. P.**
Aircraft investigations of the microstructure of the temperature fields in the troposphere and stratosphere
[BLL-M-23558-(5828.4P)] N75-28585
- BALTA, J. A. R.**
Induced currents on two dimensional electromagnetic planar structures
[AD-A005733] N75-29339
- BAR-ITZHACK, I. Y.**
Optimal design of a Mini-RPV lateral autopilot
[AIAA PAPER 75-1121] A75-41682
- BARBERO, P.**
User's guide for a revised computer program to analyze the LRC 16 foot transonic dynamics tunnel active cable mount system
[NASA-CR-132692] N75-29130
- BARGER, R. L.**
Procedures for the design of low-pitching-moment airfoils
[NASA-TN-D-7982] N75-28004

- BARMAN, J. F.**
Optimum flight profiles for short haul missions
[AIAA PAPER 75-1124] A75-41684
- BARNETT, L.**
Advanced high lift design through
analytical/experimental techniques
[AIAA PAPER 75-992] A75-41692
- BART, H. W.**
Maximum installed engine utilization through
disciplined health monitoring
[SAE PAPER 750612] A75-40519
- BASS, S. C.**
Reliable line signaling techniques for the FAA
GRN-27(V) and CAT-3 ILS
[AD-A009881] N75-29077
- BAUER, P. H.**
Wind tunnel generation of sinusoidal lateral and
longitudinal gusts by circulation of twin
parallel airfoils
[NASA-CR-137547] N75-29351
- BEAN, G. E.**
Aerodynamic design of the Boeing YC-14 advanced
medium STOL transport /AMST/
[AIAA PAPER 75-1015] A75-41696
- BECKEMEYER, R. J.**
Acoustic radiation from lined, unflanged ducts:
Acoustic source distribution program
[NASA-CR-120849] N75-28849
Acoustic radiation from lined unflanged ducts:
Directivity index program
[NASA-CR-120850] N75-28850
Acoustic radiation from lined, unflanged ducts:
Duct termination impedance program
[NASA-CR-120851] N75-28851
- BEGUHN, A. A.**
Preliminary design study of a quiet, high flow fan
(QHF) stage
[NASA-CR-134780] N75-29433
- BELOTSEKOVSKII, O. N.**
Numerical investigation of the flow of a viscous,
heat-conducting gas past a blunt body with
finite dimensions
A75-40255
- BELSON, J.**
Disc failures - A cause for concern
A75-40532
- BELTER, S.**
Reliable line signaling techniques for the FAA
GRN-27(V) and CAT-3 ILS
[AD-A009881] N75-29077
- BENDER, G. L.**
Army preliminary evaluation 1: RV-1D/quick look 2
aircraft
[AD-A005220] N75-28058
- BENNEKERS, B.**
Calculation of aerodynamic loads on oscillating
wing/store combinations in subsonic flow
N75-28015
- BENNETT, G.**
F-89 hydraulic actuator combinatorial geometric
representation
[AD-A006435] N75-29101
- BENSON, J. W.**
Balanced functional design of automatic digital
flight control systems
[AIAA PAPER 75-1088] A75-41653
- BERMAN, H.**
Digital flight control for advanced fighter aircraft
[AIAA PAPER 75-1086] A75-41651
- BERNSTEIN, U.**
The use of autocorrelation functions to predict
the effects of vertical deflections on aircraft
navigation
[AIAA PAPER 75-1101] A75-41663
- BESSEY, R. L.**
A simulation study of active feedback suppression
of dynamic response in helicopter rotor blades
[NASA-CR-132711] N75-29127
- BLAZOWSKI, W. S.**
Aircraft altitude emissions - Fundamental concepts
and future R & D requirements
[AIAA PAPER 75-1017] A75-39515
- BLIND, J. A.**
Desert storage test program
[AD-A006103] N75-29454
- BODNAR, H. J.**
Preproduction evaluation of an improved titanium
surface prebonding process
A75-40992
- BOGOMOLNYI, M. A.**
Analytical design of a monolithic wing
A75-40903
- BONIN, P. R.**
Icing tunnel test: Hot-film anemometer
[AD-A005044] N75-28404
- BOONE, J. D.**
Static fatigue behavior of cellulose and polyamide
materials
A75-40967
- BOWDEN, M. K.**
Design of short haul aircraft for fuel conservation
[SAE PAPER 750587] A75-40502
- BOWER, R. E.**
Opportunities for aerodynamic-drag reduction
N75-29016
- BRADEN, J. A.**
Advanced high lift design through
analytical/experimental techniques
[AIAA PAPER 75-992] A75-41692
- BRADLEY, E. S.**
Application of active controls technology to the
NASA Jet Star airplane
[NASA-CR-2561] N75-28049
- BRAITHWAITE, W. W.**
The concept of an interactive graphic design
system /IGDS/ with distributed computing

Longitudinal motions of aircraft involving high angles of attack [ARC-R/M-3753] N75-29094
- CONNORS, W. C.
Desert storage test program [AD-A006103] N75-29454
- CONRAD, E. W.
Trends in aircraft noise control N75-29008
- COSTES, J.-J.
Introduction of unsteady separation into acceleration potential theory Application to the helicopter A75-39331
- COTTON, W. B.
Air safety - The view from the cockpit A75-41703
- CRABTREE, R. B.
Noise levels in the CC-109, CC-115, and CC-117 aircraft [DCIEM-74-R-1059] N75-28065
- CRAMER, R. H.
Full-scale aerodynamic and engine testing of the APL Symdel Mk 6 RPV [AD-A006283] N75-29099

D

- DAHLKE, C. W.
The aerodynamic characteristics of wrap-around fins, including fold angle at Mach numbers from 0.5 to 3.0 [AD-A005574] N75-28040
- DANIELL, R. P.
Short haul transportation - The helicopter's time is now [SAE PAPER 750598] A75-40506
- DARNORY, P. P.
Kerimid 353 bis-maleimide laminating resin A75-40972
- DASH, S.
An improved numerical procedure for the parametric optimization of three dimensional scramjet nozzles [NASA-CR-132695] N75-29359
An improved source flow characteristic technique for the analysis of scramjet exhaust flow fields [NASA-CR-132697] N75-29361
- DAT, B.
Vibration tests of a structure with dry friction A75-39330
- DAVIS, G. W.
Design study of structural concepts for an arrow-wing supersonic-cruise aircraft [AIAA PAPER 75-1037] A75-39529
- DAVY, M. C. W.
10 years of STOL - The Twin Otter's first decade [SAE PAPER 750596] A75-40505
- DELANEY, R. A.
Preliminary design study of a quiet, high flow fan (QHF) stage [NASA-CR-134780] N75-29433
- DELGUIDICE, P.
An improved source flow characteristic technique for the analysis of scramjet exhaust flow fields [NASA-CR-132697] N75-29361

- DELGUIDICE, P. D.
An improved numerical procedure for the parametric optimization of three dimensional scramjet nozzles [NASA-CR-132695] N75-29359
- DENEFF, G. V.
Analytical investigation of medium STOL transport structural concepts. Volume 1: Study results [AD-A005818] N75-28060
Analytical investigation of medium STOL transport structural concepts. Volume 2: Isograd fuselage study [AD-A006157] N75-28061
- DESTUYNDER, R.
Flutter of wings equipped with large engines in pod N75-28014
- DICARLO, D. J.
Operational experiences of a commercial helicopter flown in a large metropolitan area [NASA-TN-D-8000] N75-28045
- DIEDRICH, J. H.
Summary of model VTOL lift fan tests conducted at NASA Lewis Research Center [NASA-TN-X-71778] N75-29106
- DILLENIUS, M. F. E.
Extension of the method for predicting six-degree-of-freedom store separation trajectories at speeds up to the critical speed to include a fuselage with noncircular cross section. Volume 1: Theoretical methods and comparisons with experiment [AD-A005822] N75-29071
- DISNEY, T. E.

CONTRACT NUMBER INDEX

AERONAUTICAL ENGINEERING /A Special Bibliography (Suppl 63)

NOVEMBER 1975

Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the IAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the IAA or STAR section.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to ten special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA

University of California, Berkeley

COLORADO

University of Colorado, Boulder

DISTRICT OF COLUMBIA

Library of Congress

GEORGIA

Georgia Institute of Technology, Atlanta

ILLINOIS

The John Crerar Library, Chicago

MASSACHUSETTS

Massachusetts Institute of Technology, Cambridge

MISSOURI

Linda Hall Library, Kansas City

NEW YORK

Columbia University, New York

PENNSYLVANIA

Carnegie Library of Pittsburgh

WASHINGTON

University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries:

CALIFORNIA

Los Angeles Public Library

San Diego Public Library

COLORADO

Denver Public Library

CONNECTICUT

Hartford Public Library

MARYLAND

Enoch Pratt Free Library, Baltimore

MASSACHUSETTS

Boston Public Library

MICHIGAN

Detroit Public Library

MINNESOTA

Minneapolis Public Library

MISSOURI

Kansas City Public Library

St. Louis Public Library

NEW JERSEY

Trenton Public Library

NEW YORK

Brooklyn Public Library

Buffalo and Erie County Public Library

Rochester Public Library

New York Public Library

OHIO

Akron Public Library

Cincinnati Public Library

Cleveland Public Library

Dayton Public Library

Toledo Public Library

OKLAHOMA

Oklahoma County Libraries, Oklahoma City

TENNESSEE

Memphis Public Library

TEXAS

Dallas Public Library

Fort Worth Public Library

WASHINGTON

Seattle Public Library

WISCONSIN

Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 750 Third Avenue, New York, New York, 10017.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "*" and "#", from ESRO/ELDO Space Documentation Service, European Space Research Organization, 114, av. Charles de Gaulle, 92-Neuilly-sur-Seine, France.
